This bibliography was prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by Informatics Tisco, Inc.

The Administrator of the National Aeronautics and Space Administration has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Agency. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through July 1, 1974.

AERONAUTICAL ENGINEERING

A Special Bibliography

Supplement 22

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in August 1972 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA).*

Scientific and Technical Information Office

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

SEPTEMBER 1972

Washington, D.C.

This Supplement is available from the National Technical Information Service (NTIS), Springfield, Virginia 22151 for \$3.00. For copies mailed to addresses outside the United States, add \$2.50 per copy for handling and postage.

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering.

This supplement to *Aeronautical Engineering—A Special Bibliography* (NASA SP-7037) lists 353 reports, journal articles, and other documents originally announced in August 1972 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*. For previous bibliographies in this series, see inside of front cover.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries* in that order. The citations and abstracts are reproduced exactly as they appeared originally in *IAA* or *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes—subject, personal author, and contract number—are included. An annual cumulative index will be published.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A72-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies are available at \$5.00 per document up to a maximum of 20 pages. The charge for each additional page is 25 cents. Microfiche⁽¹⁾ are available at the rate of \$1.00 per microfiche for documents identified by the # symbol following the accession number. A number of publications, because of their special characteristics, are available only for reference in the AIAA Technical Information Service Library. Minimum airmail postage to foreign countries is \$1.00. Please refer to the accession number, e.g., A72-10969, when requesting publications.

STAR ENTRIES (N72-10000 Series)

A source from which a publication abstracted in this Section is available to the public is ordinarily given on the last line of the citation, e.g., Avail: NTIS. The following are the most commonly indicated sources (full addresses of these organizations are listed at the end of this introduction):

Avail: NTIS. Sold by the National Technical Information Service as indicated:

Currently Announced Documents. Facsimile (reproduced on demand) copies are sold for \$3.00 plus 25 cents for every 5 pages over 20 pages, effective for all documents having the accession number N72-22991 (the first accession in 1972 STAR 14) or higher. The full price is shown in the citation.

Printed NASA Documents. Documents such as NASA Technical Reports, Technical Notes, Special Publications, Contractor Reports, Technical Memorandums (numbered below 50,000), and Technical Translations (below 8,000) are priced at \$3.00 for documents of 300 pages or less; \$6.00 for those in the 301-600 page range, \$9.00 for those having 601-900 pages; and individually priced above 900 pages. Documents available from both the Superintendent of Documents (SOD), Government Printing Office, and from NTIS have the SOJ price. All prices are shown in the citation.

Documents Announced Between July 1970 and July 1972. All documents with accession numbers between N70-27805 and N72-22990 are sold at the previously announced standard price, whether printed copy or facsimile is supplied. If "Avail: NTIS" appears in the citation, the document is sold at \$3.00. Any other price is shown in the citation.

Documents Announced Prior to July 1970. A surcharge of \$3.00 is applied to each document that, as of STAR Issue 14, 1972, is two years old from the time of its announcement, i.e., to all documents with an accession number lower than N70-27805 (the first accession number in Issue 14, 1970, of STAR), but not to more recently issued documents. Therefore, documents with older accession numbers of 300 pages or less are priced at a total of \$6.00. Since no surcharge is applied to documents with over 300 pages, documents in the 301 to 600-page range are also sold for \$6.00 in hard copy, and those in the 601 to 900-page range are sold at \$9.00. Those exceeding 900 pages are priced by NTIS on an individual basis, except when priced by SOD. These prices do not change with time.

Microfiche. Microfiche is available from NTIS at a standard price of 95 cents (regardless of age) for those documents identified by the # sign following the

(1) A microfiche is a transparent sheet of film, 105 x 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 24:1 reduction)

accession number (e.g., N72-10411#) and having an NTIS availability shown in the citation. Standing orders for microfiche of (1) the full collection of NTIS-available documents announced in *STAR* with the # symbol, (2) NASA reports only (identified by an asterisk (*)), (3) NASA-accessioned non-NASA reports only (for those who wish to maintain an integrated microfiche file of aerospace documents by the "N" accession number), or (4) any of these classes within one or more *STAR* categories, also may be placed with NTIS at greatly reduced prices per title (e.g., 35 cents) over individual requests. Inquiries concerning NTIS Selective Categories in Microfiche should be addressed to the Subscription Unit, National Technical Information Service.

Deposit Accounts and Customers Outside U.S. NTIS encourages its customers to open deposit accounts to facilitate the purchase of its documents now that prices vary so greatly.

NTIS customers outside the United States are reminded that they should add the following handling and postage charges to the standard or announced prices: Hard (paper) copy, \$2.50 each document, microfiche, \$1.50 each document. For subscribers outside the United States who receive microfiche through the Selective Categories in Microfiche program, NTIS will add 15 cents for each title shipped.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The price is given following the availability line. (An order received by NTIS for one of these documents will be filled at the SOD price if hard copy is requested. NTIS will also fill microfiche requests, at the standard 95 cent price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the Mississippi Test Facility, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: NASA Scientific and Technical Information Office. Documents with this availability are usually news releases or informational brochures available without charge in paper copy.

Avail: AEC Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of U.S. Atomic Energy Commission reports, usually in microfiche form, are listed in *Nuclear Science Abstracts*. Services available from the USAEC and its depositories are described in a booklet, *Science Information Available from the Atomic Energy Commission* (TID-4550), which may be obtained without charge from the USAEC Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts*, and are sold by University Microfilms as xerographic copy (HC) at \$10.00 each and microfilm at \$4.00 each, regardless of the length of the manuscript. Handling and shipping charges are additional. All requests should cite the author and the Order Number as they appear in the citation.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc., (PHI), Redwood City, California. The U.S. price (including a service charge) is given, or a conversion table may be obtained from PHI.

Avail: National Lending Library, Boston Spa, England. Sold by this organization at the price shown. (If none is given, an inquiry should be addressed to NLL.)

Avail: ZLDI. Sold by the Zentralstelle für Luftfahrtokumentation und -Information, Munich, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability: Inquiries as to the availability of these documents should be addressed to the organization shown

in the citation as the corporate author of the document.

Avail: U.S. Patent Office. Sold by Commissioner of Patents, U.S. Patent Office, at the standard price of \$.50 each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

SUBSCRIPTION AVAILABILITY

This publication is available on subscription from the National Technical Information Service (NTIS). The annual subscription rate for the monthly supplements, excluding the annual cumulative index, is \$18.00. All questions relating to subscriptions should be referred to the NTIS.

TYPICAL CITATION AND ABSTRACT FROM IAA

AERONAUTICAL ENGINEERING

A Special Bibliography (Suppl. 22) SEPTEMBER 1972

IAA ENTRIES

A72-31178 # Electronic equipment for data and signal processing on board civil aircraft (Elettronica per la elaborazione dei dati e dei segnali a bordo degli aerei civili). F. Polloni (Alitalia Linee Aeree Italiane S.p.A., Rome, Italy). In: International Electronics Conference, 19th, Rome, Italy, March 27-30, 1972, Proceedings. Rome, Rassegna Internazionale Elettronica e Nucleare, 1972, p. 81, 83-88. In Italian.

Description of recently developed avionics equipment designed to improve flight safety. The use of single sideband modulation to achieve a substantial improvement in aircraft-to-ground communications is noted, as well as the use of 'area navigation' based on an improvement in the aircraft trajectory and the introduction of 'waypoints.' The use of the Mark I, II, and III systems for gyroscope drift correction is discussed, as well as the operation of the Omega navigation system. The orientation of designers toward the use of digital rather than analog computers is noted, as well as the trend toward the elimination of mechanical parts from electronic devices and the almost complete elimination of potentiometers, due to the wide-scale substitution of linear circuits by circuits of on-off type.

A.B.K.

A72-31180 # Evolution of aeronautical communications - Critical analysis of the technical and economic aspects (Evoluzione delle telecomunicazioni aeronautiche - Analisi critica degli aspetti tecnici ed economici). P. Scravaglieri and G. Rossi (Italcable S.p.A., Rome, Italy). In: International Electronics Conference, 19th, Rome, Italy, March 27-30, 1972, Proceedings. Rome, Rassegna Internazionale Elettronica e Nucleare, 1972, p. 203, 205-211. 8 refs. In Italian.

Technical and economic survey of the progress recently achieved in the field of aeronautical communications via satellite. Some problems connected with wave propagation and noise are reviewed, and suggestions are made concerning the radiating system on board the aircraft. The adoption of a preoperational phase is proposed in which the VHF and UHF links in satellite communication systems are tested during operation together with conventional systems.

A.B.K.

A72-31201 Israel Annual Conference on Aviation and Astronautics, 14th, Tel Aviv and Haifa, Israel, March 1, 2, 1972, Proceedings. Conference convened by the Israel Society of Aeronautics and Astronautics; Technion - Israel Institute of Technology, Department of Aeronautical Engineering; Israel Ministry of Transport, Civil Aviation Administration; Israel National Committee for Space Research; Tel Aviv University, Department of Environmental Sciences and Institute of Planetary and Space Science; University of the Negev, Faculty of Engineering Sciences; Israel

Aircraft Industries; and Israel Airlines, El-Al. Conference supported by the Israel Ministry of Transport; Israel Ministry of Defence, Armament Development Authority; Israel Ministry of Commerce and Industry; Technion - Israel Institute of Technology; Tel Aviv University; University of the Negev; Aviation Services; and IBM (Israel). (*Israel Journal of Technology*, vol. 10, no. 1-2, 1972.) Jerusalem, Weizmann Science Press of Israel, 1972. 161 p. In English and French.

The papers deal with development in aeroelasticity, the application of direct methods for investigation of stability and transient motion of rotationally symmetric flying vehicles, heat transfer in turbulent separated flow downstream of a rearward facing step, boundary layers of axisymmetric bodies at small angles of attack, and the design of axisymmetric convergent cones with plane sonic outlets. Attention is given to a parametric study of a hybrid rocket motor, an aerodynamic study of two-stream propulsion systems, flow field diagnostics in rarefied slightly ionized hypersonic flow, the aeroelastic equations of a slender rotating body, nonlinear flap lag stability of hingeless helicopter blades, the nonlinear stability of hydromagnetic flows, and impurities effects on the ionization-relaxation zone behind strong normal shock waves in monatomic gases.

F.R.L.

A72-31202 * Perspectives in aeroelasticity. I. E. Garrick (NASA, Langley Research Center, Hampton, Va.). (*Israel Journal of Technology*, vol. 10, no. 1-2, 1972.) In: Israel Annual Conference on Aviation and Astronautics, 14th, Tel Aviv and Haifa, Israel, March 1, 2, 1972, Proceedings. Jerusalem, Weizmann Science Press of Israel, 1972, p. 1-22. 52 refs.

Based on selected topics, the paper is broadly aimed to indicate achievements of the past decade, the state of the art, and trends in aeroelasticity. Topics selected for this end include: brief orientation into the history of the subject, roles of active controls and the concept of aerodynamic energy in load alleviation and in flutter suppression, computerized aeroelastic analysis, aeroelastic effects in stability, aeroelastic optimization, the use of composites, recent applications of lifting surface theory to interfering surfaces and control surfaces, transonic flow considerations, and some problems related to the space shuttle.

(Author)

A72-31211 Nonlinear flap lag stability of hingeless helicopter blades. P. Friedmann and P. Tong (MIT, Cambridge, Mass.). (*Israel Journal of Technology*, vol. 10, no. 1-2, 1972.) In: Israel Annual Conference on Aviation and Astronautics, 14th, Tel Aviv and Haifa, Israel, March 1, 2, 1972, Proceedings. Jerusalem, Weizmann Science Press of Israel, 1972, p. 133-143. 11 refs. Army-supported research.

Equations for large amplitude coupled flap-lag motion of hingeless elastic helicopter blades are derived. Only torsionally rigid blades excited by quasi-steady aerodynamic loads are considered. The nonlinear equations of motion in the time and space variables are reduced to a system of coupled nonlinear ordinary differential

equations with periodic coefficients, using Galerkin's method for the variables. The resulting nonlinear system of ordinary differential equations has been solved for the case of one elastic mode in each degree of freedom using the predictor-corrector method. Results, showing limit-cycle amplitudes, are given for the nonlinear response of a blade under typical conditions. (Author)

A72-31215 Relay operation at reduced system voltage. M. G. Freed and R. Steiner (North American Rockwell Corp., Los Angeles, Calif.). In: Annual National Relay Conference, 20th, Stillwater, Okla., April 18, 19, 1972, Proceedings.

Scottsdale, Ariz., National Association of Relay Manufacturers, 1972, p. 3-1 to 3-8.

Adaptation of existing hardware in conjunction with a series capacitor to make it possible to supply power to components capable of operating at high voltage. The use of a capacitor is desirable because it functions without noticeable heat emission. The theoretical background, a laboratory test arrangement, and the advantages of such a voltage reduction technique applied to a 230 volt ac 400 Hz system are described. Recommendations are made for the practical application of this method. F.R.L.

A72-31320 The RTOL means quieter air travel. K. Wilkinson (British European Airways Corp., Ruislip, Middx., England). *New Scientist*, vol. 54, Apr. 13, 1972, p. 79-82.

It is pointed out that the short haul air traveler has gained little or nothing in end-to-end journey time since the Second World War. A number of difficulties delay the introduction of the vertical takeoff or even short takeoff civil airliner. In the meantime, the RTOL - a quiet 'reduced' takeoff aircraft - would help meet the growth in short haul traffic and bring at last some peace to the vicinity of airports. Taking the case of an RTOL aircraft designed for a stage length of 650 nautical miles and comparing direct and total costs relative to a present-day Trident 3 aircraft indicates that almost identical costs could be expected for stage length up to the design range. The RTOL benefits from its reduced taxi times, somewhat more direct air routings and reduced landing fees due to its shorter, cheaper runways. G.R.

A72-31401 Vortex-lattice method for calculating aerodynamic coefficients of a subsonic airplane. H. M. Hua. *Astronautical Society of the Republic of China, Transactions*, Nov. 1, 1971, p. 1-22. 8 refs.

The vortex-lattice method has been quite successful in optimizing the nonplanar wing and body combination. This method is now being extended to calculate the aerodynamic coefficients of a subsonic airplane. In this extension, the horseshoe vortices are oriented with the sweep, dihedral, and twist angles of lifting surfaces, and also the angles of attack and yaw. The strength of the vortices is determined with the argument that the total velocity at every control point should be parallel to the surface. The force vectors and also the aerodynamic coefficients are then calculated according to the local velocities and the vortices. The method has been verified with the lifting surfaces of the L-1011 airbus and its wind tunnel test data.

(Author)

A72-31403 An inclined gliding tunnel and techniques developed for aerodynamic design of flexible wing. S.-C. Ma (Chung-Shan Institute of Science and Technology, Nationalist China). *Astronautical Society of the Republic of China, Transactions*, Nov. 1, 1971, p. 44-55. 6 refs.

The development of an inclined type of test section suitable for flexible wing aerodynamic design is described. This type of test section provides a possibility for the close investigation of the free gliding of a flexible-wing two body system by tilting the test section to an appropriate glide angle, thus keeping the payload suspended vertically. The inclined test section is much more handy than the

horizontal test section of conventional tunnels for static testing of wing canopy rigging. This paper demonstrates the potential of the inclined test section for use in aerodynamic design of a flexible wing through a description of the technique developed for a 1.5-sq ft flexible wing model and its 230-sq ft full scale. (Author)

A72-31407 A nonlinear analysis of the transverse vibration of a helicopter rotor blade. C. Y. Lee (Chinese Air Force, Taipei, Nationalist China) and L. C. Jean (Chung-Hsing University, Nationalist China). *Astronautical Society of the Republic of China, Transactions*, Nov. 1, 1971, p. 114-134.

In this paper, the transverse vibration of a specific helicopter rotor blade under both air and centrifugal loadings during forward flight is analyzed using the structural matrix method and considering geometrical nonlinearity due to large displacements. Throughout the analysis, the rotor blade is replaced by an equivalent elastic beam of uniform sections. The displacement matrix which is expressed in terms of free-vibration mode shapes and some time-dependent multipliers is computed. (Author)

A72-31498 # Analysis of a hierarchic system of service stations (Die Analyse eines hierarchischen Systems von Bedienungstationen). A. G. Konheim (IBM Thomas J. Watson Research Center, Yorktown Heights, N.Y.) and B. Meister (IBM Forschungslaboratorium, Zurich, Switzerland). (*Gesellschaft für angewandte Mathematik und Mechanik, Wissenschaftliche Jahrestagung, Mannheim, West Germany, Apr. 13-17, 1971.*) *Zeitschrift für angewandte Mathematik und Mechanik*, vol. 52, Apr. 1972, p. T 242, T 243. In German.

Two service systems are considered, each consisting of one starting station and nine terminals. In the first, the station and terminals are arranged in the form of a single loop. The second, a multiloop system, is made up of one main loop (with the starting station and three terminals) flanked by two secondary loops (with three terminals each). As additional system components, there are two intermediate stations between the secondary loops and the main one. Under prescribed random processes, passengers arrive at the terminals and wait for transportation by helicopter to the starting station directly, in the first system, and by way of the intermediate stations, in the second system. A simple method is presented for calculating the passenger numbers waiting at the terminals and intermediate stations, on the basis of the given set of assumptions characterizing the process of passenger transportation by helicopter from the terminals and intermediate stations to the starting station. M.V.E.

A72-31596 A plane man's guide to inertial navigation. T. E. Bannan (McDonnell Douglas Corp., St. Louis, Mo.). *Esso Air World*, vol. 24, no. 4, 1972, p. 93-97.

Description of inertial navigation systems, which provide an immediate answer to current vexations and promise a future solution to the entire problem of navigation. The elements of an inertial navigation system (INS) consist of a memory containing the standard latitude and longitude coordinate system and, exclusive of power requirements, its hardware consists of a Mode Selector Unit (MSU), a digital computer and stable platform package called an Inertial Navigation Unit (INU), and a Control Display Unit (CDU) which provides a method of interface, i.e., a way for the operator to communicate with the system. The digital computer, the most complex item, is described in detail. F.R.L.

A72-31601 # Computation of the geodetic coordinates of an aircraft from two range measurements and from its height over the surface of the earth's ellipsoid (Vychislenie geodezicheskikh koordinat samoleta po dvum izmerennym rassstoianiam i ego vysote nad poverkhnost'iu zemnogo ellipsoida). K. A. Laping and L. V. Medvedev. *Geodeziia i Kartografiia*, Mar. 1972, p. 13-15. In Russian.

The antenna coordinates of an airborne radar used to generate geodetic grids can be calculated on the basis of measured range to two initial points and the height of the aircraft above the surface of the earth's ellipsoid. The proposed method does not require approximate knowledge of the aircraft geodetic coordinates, and it is not necessary to reduce the range measurements to the ellipsoid surface.

T.M.

A72-31694 # Tactical Approach Landing Radar. D. Vikan (USAF, Edwards AFB, Calif.). *American Institute of Aeronautics and Astronautics and NASA, Space Shuttle Operations, Maintenance, and Safety Technology Conference, Cocoa Beach, Fla., Mar. 29, 1972, Paper. 34 p.*

The Tactical Approach Landing Radar (TALAR) system was evaluated as a tool for analyzing and investigating the flying characteristics of low L/D aircraft in unpowered approach and landing phases of flight using an F-104D as the test aircraft. The TALAR system evaluated in this program was one which provided the capability of varying the glide slope angle up to 29.5 degrees. Results of the evaluation indicated that the approach parameters used for the TALAR test in terms of altitudes, airspeeds, L/D ratios and configuration changes are reasonable and permit consistently safe predictable approaches.

D.F.L.

A72-31697 * # Flight experiments to determine visibility requirements for approaches and landings. R. Carpenter and J. Manke (NASA, Flight Research Center, Edwards, Calif.). *American Institute of Aeronautics and Astronautics and NASA, Space Shuttle Operations, Maintenance, and Safety Technology Conference, Cocoa Beach, Fla., Mar. 29, 1972, Paper. 25 p.*

Some of the effects of horizontal visual restriction on the front cockpit of a T-33 aircraft were studied. These studies are pertinent to the establishment of guidelines that will be used in canopy design for limited visibility situations. Results of the study revealed that runway extension lines are helpful for restricted visibility situations. The superiority of a 300-foot runway over a 200-foot runway was greater than expected from geometric considerations. It was also shown that practice learning has a noticeable effect on performance. Finally, visibility restrictions that force a pilot into shallow glides should be avoided, and the available visibility should be sufficient to provide adequate information so that the pilot can solve the lateral-directional and pitch tasks simultaneously.

D.F.L.

A72-31702 # Investigation of a turbulent liquid flow between a rotating disk and a body in a radial direction (Issledovanie turbulentnogo techeniya zhidkosti mezhdu vrashchayushchimsya diskom i korpusom pri radial'nom raskhode). A. S. Baibikov, V. B. Shnepp, and S. S. Evgen'ev. *Energomashinostroenie*, vol. 18, Mar. 1972, p. 20-23. 7 refs. In Russian.

A new integral form of Reynolds equations is introduced which describes the turbulent flow of an incompressible liquid between a rotating disk and a body. Results are presented of an experimental study of the pressure along the radius for the case of a liquid flowing toward the axis of a disk. The results are in good agreement with the theoretical solution.

O.H.

A72-31703 # Cast alloys for turbocompressor blades and turbine wheels (Litye splavy dlya lopatok i turbinnykh kolek TK). M. D. Nikitin and V. P. Prozorov. *Energomashinostroenie*, vol. 18, Mar. 1972, p. 27-29. In Russian.

Short-term and long-term strength characteristics of several high-temperature steels and alloys, employed for manufacturing gas turbine rotors, disks, and blades are presented for a wide range of temperatures. Recommended operating temperatures for the steels and alloys considered are given.

O.H.

A72-31706 # An approximate method of calculation of the effect of the last stages of an axial compressor on its characteristics (Priblizhennyi metod ucheta vlianiia poslednikh stupenei oseвого kompressora na ego kharakteristiku). A. Z. Bagerman and N. P. Rubinovich. *Energomashinostroenie*, vol. 18, Mar. 1972, p. 37-39. In Russian.

An approximate method is proposed for obtaining characteristics of a multistage axial compressor for the case that one or more last stages are either removed or added. Several examples of a practical application of this method are presented.

A72-31815 Design considerations for a supersonic combustion facility and discussion of pertinent research areas. T. P. Torda (IIT Research Institute, Chicago, Ill.), B. R. Patel, and H. M. Schoenhoff. In: *International Astronautical Congress, 20th, Mar del Plata, Argentina, October 5-10, 1969, Proceedings.*

Oxford, Pergamon Press, Ltd.; Warsaw, Panstwowe Wydawnictwo Naukowe, 1972, p. 425-443. 42 refs.

Various schemes of sustaining supersonic combustion are classified into three categories: (1) use of the mixing processes between air and fuel streams to sustain and control combustion, (2) use of temperature and pressure increases across a shock to initiate and anchor supersonic combustion, and (3) use of various flame holding devices, including pilot flames to anchor and sustain combustion. Design parameters are given for a Mach 1.5-4 combustion facility which corresponds to various flight corridors. The necessary air temperature and pressure ranges are presented for nonpremixed gaseous injection. In addition to the specific facility design, three areas of basic research are discussed where investigations are of importance for supersonic ramjet design because systematic data are lacking at the present time: mixing processes in the 'near' region coupled with combustion; injection of propellants and their interaction with supersonic flow fields; and limits of flammability in turbulent flows.

A72-32017 * # Noise field of a supersonic Mach 1.5 cold model jet. J. C. Yu (George Washington University, Washington, D.C.) and D. S. Dosanjh (Syracuse University, Syracuse, N.Y.). (*Acoustical Society of America, Meeting, 81st, Washington, D.C., Apr. 20-23, 1971.*) *Acoustical Society of America, Journal*, vol. 51, May 1972, pt. 1, p. 1400-1410. 23 refs. Grant No. NGL-33-022-082.

Systematic surveys of both the near and far noise fields were made for a supersonic (nozzle design Mach number 1.5) cold model jet. The purpose of this investigation was to extend the existing understanding of the noise field of a supersonic shock-free jet at a moderate exit Mach number and the variations in its acoustic behavior when the nozzle was operated at its underexpanded mode, where strong shock waves were present. It was found that the broad-band pressure spectra of apparent sources in each of the individual characteristic flow regions were grossly similar. The strongest source for the shock-free jet was located in the region between the laminar core tip and the supersonic core tip, whereas for the underexpanded jet the strongest source was found near the middle of the flow region containing repetitive shock waves. It is shown that the significant increase in the noise output at the underexpanded mode of operation was primarily due to high-frequency components.

A72-32019 Blade interaction noise from lift fans. G. Krishnappa (National Research Council, Div. of Mechanical Engineering, Ottawa, Canada). *Acoustical Society of America, Journal*, vol. 51, May 1972, pt. 1, p. 1464-1470. 11 refs.

The discrete-frequency noise radiation from a single-stage lifting fan is analytically estimated from measured steady and unsteady aerodynamic data on the fan and compared with the measured noise levels. Unsteady forces acting on the stator blades are calculated from measurements of the rotor blades' wake, using a hot-wire

anemometer. The viscous interaction noise estimated is compared with the potential interaction noise from the rotor blades. Rotor potential-flow interaction and stator viscous interaction noise both seem to be important in the case of close rotor-stator spacing. The estimated results show a reasonable agreement with the measured results. (Author)

A72-32023 # Airfoil in a contracting or diverging stream. B. Lakshminarayana (Pennsylvania State University, University Park, Pa.) and M. T. White. *Journal of Aircraft*, vol. 9, May 1972, p. 354-360. 6 refs.

Theoretical and experimental investigation of the flow around an airfoil in a contracting or diverging stream. An expression for the vortex distribution, which satisfies the kinematic condition on the airfoil surface and the Kutta condition at the trailing edge, is derived. The predicted values of the lift and the surface pressure distribution, at various values of incidences and mean flow acceleration, agree very well with the measured values. In converging flow, the circulation and lift are found to increase with increase in velocity ratio (ratio of outlet to inlet velocity). Considerable change in airfoil pressure distribution is observed, its effect being dominant on the suction surface. With diverging mean flow, both circulation and lift decrease with decrease in velocity ratio. The decrease in mean velocity seems to have dominant effect on the pressure surface. (Author)

A72-32024 # Some recent MIT research on dynamic stall. N. D. Ham (MIT, Cambridge, Mass.). *Journal of Aircraft*, vol. 9, May 1972, p. 378, 379. 5 refs. Army-Navy-sponsored research.

A summary is presented of a recent study on airfoil dynamic stall. The boundary-layer flow processes during dynamic stall are tentatively defined. Results suggest that the observed delay in the occurrence of leading-edge separation is due to the delay in the forward movement of the reattachment portion of the separation bubble as the angle of attack is increased. O.H.

A72-32025 # Some results of suboptimal gust alleviation. R. A. Hess (U.S. Naval Postgraduate School, Monterey, Calif.). *Journal of Aircraft*, vol. 9, May 1972, p. 380, 381.

Results are presented regarding the gust alleviation design, wherein the desirability of on-line information about the vertical gust angle-of-attack perturbation is demonstrated from the standpoint of mean square performance. In addition, the feedback variables are restricted to those which can be measured most readily. Finally, the resulting feedback configuration is shown to be similar in form to a simple 'acceleration autopilot' and to utilize the so-called 'essential feedbacks' normally associated with effective vertical gust alleviation. O.H.

A72-32042 The true perspective path in the sky, an approach to aircraft navigation. J. La Russa and M. C. Baum (Farrand Optical Co., Inc., Valhalla, N.Y.). In: Electro-Optical Systems Design Conference, New York, N.Y., September 14-16, 1971, Proceedings. Chicago, Industrial and Scientific Conference Management, Inc., 1971, p. 106-113.

Description of a head-up display system that provides a true three-dimensional sky path extending from the aircraft to any desired location such as a touchdown point on a runway. This display literally enables the pilot to 'drive' the aircraft down to a landing. Actual airspeed, desired airspeed, steering errors, crab angle, roll attitude, pitch attitude, angle of attack, runway outline, and an artificial horizon are all provided as picture analogs thereby reducing interpretation time. Computer units, the CRT display system, and image generating subsystems are outlined. T.M.

A72-32045 Design of a laser velocimeter for use in turbomachinery. A. Hauer and W. G. Alwang (United Aircraft Corp., Pratt and Whitney Aircraft Div., East Hartford, Conn.). In: Electro-Optical Systems Design Conference, New York, N.Y., September 14-16, 1971, Proceedings. Chicago, Industrial and Scientific Conference Management, Inc., 1971, p. 137-153. 21 refs.

The selection of a laser Doppler velocimetry (LVD) system design is discussed that is suitable for the measurement of intrablade flow in turbomachinery. As an optical method for measuring the velocity of flowing fluids, LVD dispenses with the necessity of introducing any hardware into the stream and does away with many of the difficulties and uncertainties experienced with ordinary physical probes. Other advantages are reviewed, and the interrelationships of the instrument design parameters with its performance are examined. The various options available for signal processing are also discussed. M.V.E.

A72-32072 Airborne collision avoidance and other applications of time/frequency. R. E. Perkinson and F. D. Watson (McDonnell Douglas Electronics Co., Saint Charles, Mo.). *IEEE, Proceedings*, vol. 60, May 1972, p. 572-579. 31 refs.

Time/frequency technology provides a reliable aircraft collision avoidance system (CAS) that can operate in either synchronous or asynchronous modes. Precision time-ordered techniques of CAS provide both range and range-rate measurements in a one-way sense to all aircraft as well as ground stations within range of transmitted microwave signals. The cooperative system utilizes exact frequency references coupled with precise synchronization: control of frequency to one part in 100 million and time to less than 1 microsec. In addition to performing specific functions of protecting aircraft, the time/frequency CAS provides a means for wide dissemination of submicrosecond timing. Flying clocks, which are an integral part of the airborne CAS, have been providing transcontinental and intercontinental transfer of time since 1964. CAS ground stations can serve as depositories of time and frequency derived from flying clocks, satellites, Loran-C and Omega navigation systems, or television transfer referenced to national and international time/frequency standards. (Author)

A72-32073 Time/frequency and transportation. C. E. Potts and J. F. Roeber (U.S. Coast Guard, Electronics Engineering Div., Washington, D.C.). *IEEE, Proceedings*, vol. 60, May 1972, p. 579-589. 51 refs.

Current and future problems are presented for the land, sea, and air transportation environments that are, or can be, solved using time/frequency technology. Problem areas encompass vehicle surveillance and location, traffic management, collision avoidance, command and control, communications, navigation, and search and rescue. The need for time/frequency technology in the orderly and safe movement of people and material is shown to be a function of the type of transportation and environment involved. Various characteristics of the transportation environments are discussed, and time-related aspects of transportation are designated. Recommendations are presented for broad coordination in the development and introduction of electronic systems for transportation services. O.H.

A72-32097 Review of models of the air traffic control system. N. Moray and L. D. Reid (Toronto, University, Toronto, Canada). *CATCA Journal*, vol. 4, Spring 1972, p. 9-14. 33 refs.

Attempt to assess the state of the art in fast time simulation of ATC systems, with particular emphasis on models of the human controller. Fast-time simulation is found to be a useful tool for dealing with studies of ATC systems. However, past models have generally failed to include a realistic interactive human controller as part of the simulation. At the present time there is no suitable model for the human controller that will allow a realistic simulation of the

interactive effects involving the human element. More of an applied psychology approach to modeling the controller is required if a realistic model is to be achieved. The simulation should be developed with the close cooperation of ATC personnel to assure a realistic model. F.R.L.

A72-32098 A digital simulator for ATC procedures training. R. Cottis and P. Baird (GEC-Marconi Electronics, Ltd., Chelmsford, Essex, England). *CATCA Journal*, vol. 4, Spring 1972, p. 15, 18, 20.

Discussion of digital radar simulators which can be used for training at all levels. The switch can be made from one training level to another in a very short time. The simulators work with great precision, achieve great realism, and are simple to use. There are always five categories of information which are required for setting an exercise: geography, radar characteristics, wind characteristics, aircraft characteristics, and flight plans. Two types of training program which can be arranged with the digital simulator are considered. F.R.L.

A72-32125 # Results of preliminary parametric design analysis of an Arctic surface effect vehicle. P. R. Scheurich, Jr. and M. A. Kidd (U.S. Naval Material Command, Ship Research and Development Center, Washington, D.C.). (*Canadian Symposium on Air Cushion Technology, 5th, Ottawa, Canada, Sept. 1, 1971.*) *Canadian Aeronautics and Space Journal*, vol. 18, May 1972, p. 129-134. 10 refs.

A discussion is presented of the primary variables of vehicle gross weight, design cushion pressure, vehicle velocity, length/beam ratio and gap height that are considered in the vehicle design and performance trade-off studies. The data are generated by a computer program where each variable in turn is fixed and the remaining parameters are varied to create a matrix of Surface Effect Vehicle (SEV) designs. In addition, the secondary variables of wave height, skirt height, terrain roughness, system efficiencies, fuel and payload fractions, aerodynamic drag and lift coefficients, and the specific fuel consumption have been considered in the design analysis. Conclusions on how these parameters affect the design of a surface effect vehicle are presented. (Author)

A72-32127 * # Engine selection for transport and combat aircraft. J. F. Dugan, Jr. (NASA, Lewis Research Center, Cleveland, Ohio). *NATO, AGARD, Conference on Aircraft Performance - Prediction Methods and Optimization, Brussels, Belgium, Apr. 24-28, 1972, Paper. 76 p. 23 refs.*

Review of the procedures used to select engines for transport and combat aircraft by illustrating the procedures for a long haul CTOL transport, a short haul VTOL transport, a long range SST, and a fighter aircraft. For the CTOL transport, it is shown that advances in noise technology and advanced turbine cooling technology will greatly reduce the airplane performance penalties associated with achieving low noise goals. A remote lift fan powered by a turboprop air generator is considered for the VTOL aircraft. In this case, the lift fan pressure ratio which maximizes payload also comes closest to meeting the noise goal. High turbine temperature in three different engines is considered for the SST. Without noise constraints it leads to an appreciable drop in DOC, but with noise constraints the reduction in DOC is very modest. For the fighter aircraft it is shown how specific excess power requirements play the same role in engine selection as noise constraints for commercial airplanes. F.R.L.

A72-32136 * # Hot-salt stress-corrosion of titanium alloys as related to turbine engine operation. H. R. Gray (NASA, Lewis Research Center, Cleveland, Ohio). *Metallurgical Society and American Society for Metals, International Conference on Titanium,*

2nd, Cambridge, Mass., May 2-5, 1972, Paper. 12 p. 15 refs.

Demonstration that the major variables influencing hot-salt stress-corrosion of titanium alloys are alloy processing conditions, heat-to-heat variations and composition, surface condition, and cyclic exposures. Under simulated compressor environmental conditions the commonly used 64 alloy is creep limited and not stress-corrosion limited. Cyclic exposures to stress-corrosion conditions are not as detrimental as continuous exposures for equivalent total times. F.R.L.

A72-32142 # Lifting line theory for a wing with a flat plate placed near its tip. K. Moriya. *JSME, Bulletin*, vol. 15, Apr. 1972, p. 466-474; Discussion, p. 474; Author's Closure, p. 474, 475. 8 refs.

In order to obtain the blade characteristics of an axial fan with an orifice-type fan guide, the influence of the fan guide on the blade characteristics is investigated by establishing a theoretical model in which a flat plate parallel to the wing surface is placed near its tip. As the result, a Prandtl-type integral equation for this wing model is derived. In the present paper, the equation is solved when the wing and the plate are in the same plane. Furthermore, the wing planform and its aerodynamic forces satisfying the condition of minimum induced drag are also presented. Thus, the fundamental blade characteristics are clarified concretely. (Author)

A72-32147 # An approximate theory for a jet flap with the wall effect by analogy to a mechanical flap. T. Kida and Y. Miyai (Osaka Prefecture University, Sakai, Osaka, Japan). (*Japan Society for Aeronautical and Space Sciences, General Meeting, 1st, Japan, Apr. 7, 1970.*) *Japan Society for Aeronautical and Space Sciences, Transactions*, vol. 14, no. 24, 1971, p. 9-25. 7 refs.

It was suggested by Stratford (1956) that the similarity between the jet flap and the mechanical flap could be exploited to provide a means of calculating the pressure lift induced by the jet. He proposed the criteria of equivalence whereby (1) the aerodynamic lifts on the flaps are to be exactly equal, and (2) the flap angles are to be equal. The amended criteria shown in this paper specify similarity of the drags on the flap and equal induced thrusts at the leading edge. Numerical calculations were carried out for the cases where a jet-flapped airfoil was set in proximity to the ground, beneath a free surface, and in a rigid wall tunnel. (Author)

A72-32182 # Booster abort guidance. V. S. Sohoni (IBM Corp., Huntsville, Ala.). In: *The growth and maturity of navigation in space; Proceedings of the National Space Meeting, Orlando, Fla., March 15, 16, 1972.* Washington, D.C., Institute of Navigation, 1972, p. 48-62. 5 refs.

Discussion of a Booster abort guidance scheme (for critical aborts), from the time of staging until propellant depletion. The guidance scheme is formulated under the following assumptions: (1) instantaneous separation of the Booster and Orbiter vehicles, and (2) all systems of the Booster vehicle are operational with the exception of a possible loss of two out of twelve of the Booster engines. The scheme minimizes the aerodynamic phases during the abort phase and also meets the desired constraints at the Booster cutoff. The scheme is thoroughly evaluated for various abort situations and different landing sites, and the detailed results are included. O.H.

A72-32201 Navigation for general aviation and navigation training; *Proceedings of the National Air Meeting, Atlanta, Ga., Feb. 29-Mar. 2, 1972.* Meeting sponsored by the Institute of Navigation. Washington, D.C., Institute of Navigation, 1972. 113 p. Members, \$10.00; nonmembers, \$15.

Recent developments in navigation techniques and equipment for training purposes and for general aviation applications are described. Topics considered include general aviation requirements for area navigation, use of Doppler systems in area navigation,

provision of intermediate waypoints for inertial equipped aircraft on great circle paths, navigator training simulators, air traffic conflict prediction and resolution, determination of downed-aircraft position, landing and approach systems, and ground mapping radar.

T.M.

A72-32202 # General aviation requirements for RNAV. M. V. Huck (Aircraft Owners and Pilots Association, Washington, D.C.). In: Navigation for general aviation and navigation training; Proceedings of the National Air Meeting, Atlanta, Ga., Feb. 29-Mar. 2, 1972. Washington, D.C., Institute of Navigation, 1972, p. 1-3.

General aviation RNAV requirements differ from those of other users because of the vast number of flight tracks necessary to serve all airports utilized by this segment of the industry. The present policy of FAA to devise an RNAV airway structure similar to that used in the standard VORTAC system does not take full advantage of the inherent flexibility of area navigation techniques and, if continued, will greatly inhibit the installation of equipment by general aviation users. Introduction of random routing using area navigation will be possible when FAA completes the upgraded third generation ATC system if the automation equipment is programmed to allow control personnel to predict the entry point of a given aircraft in any control sector so ATC planning for separation can take place. Only then will the true potential of RNAV be realized.

(Author)

A72-32203 # Doppler systems applied to area navigation. F. Carpinello and H. Buell (Singer Co., Kearfott Div., Pleasantville, N.Y.). In: Navigation for general aviation and navigation training; Proceedings of the National Air Meeting, Atlanta, Ga., Feb. 29-Mar. 2, 1972. Washington, D.C., Institute of Navigation, 1972, p. 4-7.

The intent of this paper is to show why and how Doppler navigation equipment is suited to the requirements of R-NAV. The discussion points out the advantages of self-contained Doppler navigation systems such as versatility of routes, continuous velocity vector data for controlled arrival time, and accuracy with little or no need to update. A description is given of an R-NAV system comprised of a particular Doppler velocity sensor with optional navigational computer sets. The presentation of specific equipment relates real, operational hardware to the area navigation problem.

(Author)

A72-32204 # Digital mechanization for single beam Doppler navigation. J. L. Farrell (Westinghouse Electric Corp., Systems Development Div., Baltimore, Md.). In: Navigation for general aviation and navigation training; Proceedings of the National Air Meeting, Atlanta, Ga., Feb. 29-Mar. 2, 1972. Washington, D.C., Institute of Navigation, 1972, p. 8-14. 9 refs.

With the advent of digital computer-centered integrated avionics, the usual multiple beam Doppler navigator can be replaced by intermittent scanning of a single beam multi-mode radar. An improved avionics mechanization is described for airborne Doppler navigation, augmented by an independent vertical instrumenting channel (accelerometer data combined with barometric information). By taking advantage of optimum statistical data processing methods, the scheme can eliminate most of the voltage controlled oscillator drift effect. Navigation error is then reduced to a level determined by the uncertainty in main beam clutter center frequency, arising from the inherent frequency spread across the antenna beam. Detailed investigation of the estimation algorithm, employing Penrose generalized inverses, demonstrates certain algebraic intricacies which go unnoticed when purely numerical solutions are obtained. (Author)

A72-32205 # Great Circle waypoints for inertial equipped aircraft. R. J. Holm (Litton Industries, Inc., Aero Products Div.,

Woodland Hills, Calif.). In: Navigation for general aviation and navigation training; Proceedings of the National Air Meeting, Atlanta, Ga., Feb. 29-Mar. 2, 1972. Washington, D.C., Institute of Navigation, 1972, p. 15-26.

Formulation of a method to provide intermediate waypoints on Great Circle tracks for inertial equipped aircraft. By the use of the process it is shown that 24 n mi can be saved on the Great Circle route over Jet Airway 134 (Washington to Los Angeles). The waypoints are for position check with respect to ground radio stations and for prior designation as reporting waypoints. F.R.L.

A72-32206 # R-NAV and TALAR, complementary systems. D. J. Crabtree (Golden West Airlines, Inc., Newport Beach, Calif.) and F. T. Gasper (Singer Co., Kearfott Div., Little Falls, N.J.). In: Navigation for general aviation and navigation training; Proceedings of the National Air Meeting, Atlanta, Ga., Feb. 29-Mar. 2, 1972. Washington, D.C., Institute of Navigation, 1972, p. 27-37.

This paper describes a hybrid system configuration which yields total enroute and landing navigation capability. The application involves the operations of a commuter airline and their use of modern avionics in a complementary transitioning format. Basic subsystem descriptions and overall system mechanization is described. Operational procedures and usage is given for a typical route structure, with emphasis placed on the transitioning activity. User goals and expectations as well as flight results and accomplishments achieved to date are discussed. (Author)

A72-32207 # Instructional systems development and navigator training. C. E. Walden (USAF, Mather AFB, Calif.). In: Navigation for general aviation and navigation training; Proceedings of the National Air Meeting, Atlanta, Ga., Feb. 29-Mar. 2, 1972. Washington, D.C., Institute of Navigation, 1972, p. 38-41.

Data interpretation, integration, and systems backup demand, and will continue to demand, a highly trained professional individual in the field of navigation. Producing such an individual requires transfer of knowledge and training. It is Air Training Command's job to provide the relevant knowledge and best possible training at the least possible cost of time and money. The Instructional Systems Development approach is a management tool designed to insure cost-effective achievement of specified objectives. The purpose of this paper is to examine the Instructional Systems Development approach as applied to Air Force Navigator training at Mather AFB, California. Implementation, impact, and problem areas are addressed. (Author)

A72-32208 # Navigation training simulators. M. H. Stephenson and R. L. Feuge (Honeywell, Inc., West Covina, Calif.). In: Navigation for general aviation and navigation training; Proceedings of the National Air Meeting, Atlanta, Ga., Feb. 29-Mar. 2, 1972. Washington, D.C., Institute of Navigation, 1972, p. 42-51.

Honeywell is currently designing and manufacturing the Undergraduate Navigator Training System (UNTS) for the U.S. Air Force Aeronautical Systems Division and the Air Training Command. This paper describes the design and human factors philosophy of the UNTS, an all-digital trainer that simulates a complete array of air navigation instruments. The discussion emphasizes in particular the training objectives to be met, how the trainer is designed to meet these objectives, and the simulation concepts employed to activate the navigation instruments. (Author)

A72-32209 # Air navigation training in the Canadian Armed Forces. J. Hennessey and A. D. Lee (Department of National Defence, Air Navigation School, Westwin, Manitoba, Canada). In: Navigation for general aviation and navigation training; Proceedings

of the National Air Meeting, Atlanta, Ga., Feb. 29-Mar. 2, 1972. Washington, D.C., Institute of Navigation, 1972, p. 52-58.

The paper presents the current variety of students and the specific training program designed for them. The primary technique employed in conducting academic, synthetic, and air training is performance oriented. Using lecture response and programmed learning methods, the students are prepared to solve problems. Using synthetic exercises and trainers, the students gradually meet the problems in a more varied combination and in a practical order and time frame. Finally air training is used to demonstrate the validity of problem solutions and to instill self-confidence in the student. The responsibility of the navigator is also instilled early by making the student the sole navigator of the training aircraft. Responsible navigation is a must because operational units expect the graduate to perform immediately with training only in operational requirements and tactics. (Author)

A72-32210 # Navigation training at the USAF Academy. B. T. Parker (U.S. Air Force Academy, Colorado Springs, Colo.). In: Navigation for general aviation and navigation training; Proceedings of the National Air Meeting, Atlanta, Ga., Feb. 29-Mar. 2, 1972. Washington, D.C., Institute of Navigation, 1972, p. 59-62.

Navigation training at the United States Air Force Academy is unique. The training is directed not only at future Air Force line navigators, but also at future pilots and combat support officers. The courses are designed to acquaint the cadet with the science of navigation rather than to train him to be a navigator. The basic course, Navigation Indoctrination, is the mainstay of the Navigation Division. The course covers basic dead reckoning, map reading, radar, day celestial, weather, airways and instrument flying, and an introduction to advanced techniques and equipment. The Navigation Concepts and Systems Development Course expands on the cadet's basic knowledge and strives to stimulate his mind toward the development and uses of advanced equipment and techniques. Descriptive Astronomy presents the fundamentals of astronomy, properties of the solar system and stellar astronomy. Introduction to Applied Astronomy covers, in the classroom, spherical and stellar astronomy. The course is enriched with laboratory exercises in the Academy's observatory and 50-foot planetarium. (Author)

A72-32211 # Flight simulation for less than \$1,000. J. E. Sidoti (Analog Training Computers, Inc., West Long Branch, N.J.). In: Navigation for general aviation and navigation training; Proceedings of the National Air Meeting, Atlanta, Ga., Feb. 29-Mar. 2, 1972. Washington, D.C., Institute of Navigation, 1972, p. 63-78.

Discussion of the ATC-510 Personal Flight Simulator, a \$995 equipment which contains all Instrument Flight Rules instrumentation, including audio taped controllers instructions and a turbulence injection device to subject the pilot to additional challenges of difficult flight conditions. The wide simulation flexibility achieved by varying flight assignments and turbulence conditions provides an adequate accommodation to pilots of widely different qualifications. V.Z.

A72-32213 # Air traffic conflict prediction and resolution. H. A. Wachsman (FAA, Washington, D.C.). In: Navigation for general aviation and navigation training; Proceedings of the National Air Meeting, Atlanta, Ga., Feb. 29-Mar. 2, 1972. Washington, D.C., Institute of Navigation, 1972, p. 83-86.

In a continuing effort to further increase the safety of the National Airspace System, the Federal Aviation Administration is engaged in a broad investigation of collision avoidance techniques which promise the reduction of the mid-air collision threat. The on-going development and evaluation includes air-borne systems

which require avionics installation in aircraft, and ground-based methods which require refinement of existing subsystem capabilities. The development of such a ground-based system was contained in the recommendations of the Air Traffic Control Advisory Committee, and is termed a 'Safety/Separation' Service. The governing factors in the development of the Safety/Separation Service extend beyond the obvious requirement of reliability, to include the ability to interface with the current air traffic control system as well as to integrate into the long-range National Airspace System plan which extends to the end of this century. (Author)

A72-32214 # Locating downed aircraft by GRAN /Global Rescue Alarm Net/. W. R. Crawford and W. E. Rupp, Jr. (U.S. Navy, Naval Air Test Center, Patuxent River, Md.). In: Navigation for general aviation and navigation training; Proceedings of the National Air Meeting, Atlanta, Ga., Feb. 29-Mar. 2, 1972. Washington, D.C., Institute of Navigation, 1972, p. 87-91.

This paper describes a worldwide distress alarm, identification, and position location system which could be operational within three years. The Global Rescue Alarm Net (GRAN) feasibility tests conducted by the Naval Air Test Center utilized a NASA Omega Position Locating Equipment (OPLE) package modified for UHF operation. Results of low power (ERP) tests with four satellites are discussed. Follow-on tests already funded by a Navy/NASA/Coast Guard joint program to develop system specifications are described. (Author)

A72-32215 # Use of procurement techniques similar to civil avionics in order to reduce military systems' costs. J. S. Gansler (ITT, ITT Avionics Div., Nutley, N.J.). In: Navigation for general aviation and navigation training; Proceedings of the National Air Meeting, Atlanta, Ga., Feb. 29-Mar. 2, 1972. Washington, D.C., Institute of Navigation, 1972, p. 92-98. 7 refs.

There has been much talk recently about the desirability of using civil avionics procurement techniques in order to reduce the military systems' costs. This paper attempts to quantify some of this discussion. Specifically, it addresses itself to three financial problem areas of military avionics procurement: (1) high acquisition costs, (2) significant program cost growths, and (3) large total costs-of-ownership. This paper suggests further techniques which can be learned from the civil area for greater cost reductions. Particular emphasis is given to cost/reliability design criteria and to warranty to cover follow-on costs. Specific examples of potential overall cost savings on airborne avionics equipment are presented for these recommended cost saving techniques. (Author)

A72-32217 # Outlook for low-cost landing system. F. B. Pogust (Cutler-Hammer, Inc.; AIL Div., Farmingdale, N.Y.). In: Navigation for general aviation and navigation training; Proceedings of the National Air Meeting, Atlanta, Ga., Feb. 29-Mar. 2, 1972. Washington, D.C., Institute of Navigation, 1972, p. 102-108.

Discussion of the prospect for replacement of interim landing systems (ILS) with microwave landing systems (MLS) in civil aviation operations. The outlook for a low-cost microwave scanning beam system is believed to be promising. However, only a small number of ground systems of that type are expected to be installed in the near future because of the absence of urgency for replacement. V.Z.

A72-32250 Handbook of airfoil sections for light aircraft. M. S. Rice. Milwaukee, Wis., Aviation Publications, 1971. 138 p. \$3.95.

A broad selection of airfoil section designs is presented, covering major European and North American wind tunnel studies. It is pointed out that many of these airfoil sections are theoretical only

and that less than 20 of them have been utilized in commercially produced light aircraft. Sections are available for all requirements involving high and low speeds, slow landings, high rates of climb, high aircraft gross weight, and long range. G.R.

A72-32319 # R & D pays off for inlet/engine matching. R. Crites, P. Czyns, and F. Lynch (McDonnell Douglas Corp., St. Louis, Mo.). *Astronautics and Aeronautics*, vol. 10, June 1972, p. 64-67.

The inlet duct must supply the engine with proper mass flow and relatively uniform pressure distribution over a wide range of altitudes and Mach numbers. A vast amount of test data has to be considered in connection with the design of the inlet. It has been proposed to digitize the inlet data in order to correlate it with corresponding compressor behavior. An integrated data acquisition and processing system is considered. Problems with an all-digital approach at the present time appear to dictate a thorough exploration of an analog or a hybrid approach. A combination of on-line computations, detection and display at the test site meets the requirements. G.R.

A72-32321 An airports system for United Kingdom air services /19th Mitchell Memorial Lecture/. P. Masfield. *Aeronautical Journal*, vol. 76, May 1972, p. 275-285.

The requirements for accessible, economic, operationally satisfactory, and socially acceptable airports are reviewed, and characteristics of a national airports plan are discussed. Airport categories are specified and confronted with the population areas in the UK and the currently available airports. Based on statistical data, detailed features of the network of future airports in the UK are outlined. O.H.

A72-32322 An end to aircraft noise. L. G. Dawson and T. D. Sills. *Aeronautical Journal*, vol. 76, May 1972, p. 286-293, 296, 297; Discussion, p. 293-295.

The technical feasibility of building a subsonic aircraft and engine combination quiet enough not to annoy the public is discussed. It is demonstrated that, with adequate research and development, it should be feasible to produce a modified version of an RB.211 with a noise standard 9 PNdB lower. Steps are shown by which, with a twin-engined aircraft with the quieter RB.211 engines, the 85-PNdB noise footprint of a 150-200 seat short/medium-range RTOL aircraft can be reduced to 2 sq m. O.H.

A72-32323 Optimal paths for minimising landing transition distance for jet-lift VTOL aircraft. E. Huntley (Sheffield, University, Sheffield, England). *Aeronautical Journal*, vol. 76, May 1972, p. 308-317. 5 refs.

The problem is examined of how should the controls be operated and the flight path chosen in order to bring a jet-lift VTOL aircraft to rest on the ground in an optimum fashion. The approach to this problem is based on an intuitive search for near-optimum solutions by means of physical arguments. Previous Lean's analysis (1966) of the use of incidence control and investigating the optimal choice of transition path is extended. The question is then considered of how to achieve consistent, if suboptimal, control of the transition which, in turn, involves further discussion of control usage. The emphasis throughout is on minimization of transition distance with the immediate aim of minimizing the pilot's problem of judging distance to the hover point. O.H.

A72-32344 # Unsteady viscous flow around an oscillating elliptic aerofoil. A. Okajima, T. Asanuma, and H. Takata. *Tokyo, University, Institute of Space and Aeronautical Science, Bulletin*, vol.

8, Jan. 1972, p. 1-35. 10 refs. In Japanese, with abstract in English.

The unsteady normal force, moment, and surface pressure exerted on an oscillating elliptic aerofoil of 20% thickness ratio are measured over wide ranges of Reynolds number (40 to 20,000), angle of attack (0 to 25 deg), and reduced frequency ($k = 0.1$ to 1.4). A good agreement is found between the results of the present experiment and those of the numerical calculation given in the previous paper. From the viewpoint of the viscous effects of flow, influences of Reynolds number, angle of attack, and reduced frequency on these aerodynamic forces are discussed for the aerofoil which is in either a nonstalled or stalled state. Experimental results are also compared with those of the potential flutter theory for a flat plate or a von Mises profile, those of the modified potential flutter theory proposed by Rott and George, and those predicted by the quasi-steady theory. (Author)

A72-32399 Infrared studies on the jet exhaust of a turbojet aircraft. A. K. Ray and M. R. Katti (Defence Science Laboratory, Delhi, India). *Defence Science Journal*, vol. 21, Oct. 1971, p. 273-282. 11 refs.

In an attempt to evaluate the effective infrared radiant energy from a conical jet exhaust of a jet aircraft, infrared emission characteristics have been worked out with special reference to guidance and decoy purposes. Suitable infrared absorbing materials used for shielding the infrared emitting skin of the radiating part have also been discussed. Attempts have also been made to evaluate the effective radiation on a detecting system after allowing for the solar radiant heat and also atmospheric absorption. (Author)

A72-32427 # TriStar - Structural features. *Aircraft Engineering*, vol. 44, May 1972, p. 4-9.

The primary functional systems of the aircraft include hydraulic, electrical, electronic, environmental control, and auxiliary power systems. Stations are provided for three crew members and two observers. Precise aircraft flight path control is assured by the use of a fully powered flight control system. Handling ease is achieved by four independent hydromechanical systems. Details of the navigation system are considered together with the avionic flight control system, flight instrumentation, the airframe structure, aircraft propulsion, the fuel system, and the cargo and baggage capacity. G.R.

A72-32428 # Development and modifications of the RB 211 engine. *Aircraft Engineering*, vol. 44, May 1972, p. 13-16.

The Rolls-Royce RB 211 three-shaft turbofan engine, rated at 42,000 lb takeoff thrust, is now being delivered in quantity to Lockheed for installation in TriStar airliners. It was recognized that the major source of noise would be the fan. It was, therefore, decided to incorporate a single stage fan without inlet guide vanes, with adequate spacing between fan blade and its outlet guide vanes. A number of development problems are discussed, giving attention to the containment casing for the titanium blades and the reduction of the smoke level. G.R.

A72-32429 # Adhesive bonding of large fuselage panels. *Aircraft Engineering*, vol. 44, May 1972, p. 20-22.

As developed, the TriStar body is a conventional shell construction with a constant cross-section of 235 in. diameter along most of its length. Bonding is utilized throughout the 150 ft of airframe pressurized zone to join doublers and triplers around openings in the skin. Development work conducted between Lockheed and supply firms culminated in the decision that only an epoxy-based material would provide the basic properties capable of meeting the established goals. The various steps required in the bonding process are discussed. G.R.

A72-32430 # Maintenance of the 747. Aircraft Engineering, vol. 44, May 1972, p. 23-25.

The Boeing 747 maintenance program, as approved by the Federal Aviation Administration Maintenance Review Board, was a major advance for new aircraft maintenance programs. The acceptance of condition monitoring and threshold levels for engine inspections contained within this program provided key starting points for further advances in maintenance technology. The JT9D engine performance monitoring was developed into a computer program which takes engine cruise parameter readings, converts them into standard day conditions, and prints a daily graph for each engine.

A72-32451 Managing to be on time: A total system approach in aircraft operations; Royal Aeronautical Society, Spring Convention, London, England, May 10, 11, 1972, Proceedings. London, Royal Aeronautical Society, 1972. 205 p.

The papers deal with management of short-haul airlines to ensure on-time operations, time schedules in a military environment, airport problems affecting on time operations, and air traffic control with reference to system coordination. Some of the current activities by which product support can help operators to minimize delays are reviewed. The design approach to maintainability of Concorde engines, the role of the management information system, and the influence of airframe design on availability are discussed. An attempt is made to review the total management problem of staying on time with the Concorde.

F.R.L.

A72-32452 # Managing - Short-haul airlines - To be on time. J. Garton (British European Airways Corp., Ruislip, Middx., England). In: Managing to be on time: A total system approach in aircraft operations; Royal Aeronautical Society, Spring Convention, London, England, May 10, 11, 1972, Proceedings. London, Royal Aeronautical Society, 1972. 21 p.

Identification of the problem sectors of a typical short haul, classical hub and spoke type operator (BEA). Their size in quantity and cost are stated and briefly examined. Major attention is focused on the technical reliability sector problem, with statement of the factors, mechanical and human, of the punctuality equation. The technical, operational, and financial management systems, and the staff training and development programs are defined. The day to day control of front-line activities is given in terms of organization, communications, and unserviceability control. Some of the technical problems which would yield to concentrated effort are studied.

F.R.L.

A72-32453 # Time in a military environment. P. C. Cleaver. In: Managing to be on time: A total system approach in aircraft operations; Royal Aeronautical Society, Spring Convention, London, England, May 10, 11, 1972, Proceedings. London, Royal Aeronautical Society, 1972. 19 p.

Review of the time parameter in its many contexts over the whole spectrum of military operations ranging from transport through maritime reconnaissance, strike, ground attack and air defence operations to the day-to-day problems of operating training aircraft in the confined and busy airspace over the UK. Particular problem areas are highlighted where appropriate. Among the major problems, however, is the economic state of the country which, to some extent, controls national defence policy.

F.R.L.

A72-32454 # Managing to be on time - Airport problems. N. J. Payne (British Airports Authority, London, England). In: Managing to be on time: A total system approach in aircraft operations; Royal Aeronautical Society, Spring Convention, London, England, May 10, 11, 1972, Proceedings.

London, Royal Aeronautical Society, 1972. 11 p.

Study of the importance of total journey time to air passengers and cargo, the times currently spent at airports by air passengers and cargo, airport planning concepts to save passenger time on the ground, and the interaction of time, capacity, congestion, and cost, which summarizes most airport problems. Changes in total time have had marked effects on traffic growth. On average, departing air passengers spend over an hour in the airport terminals, of which less than 10 minutes are spent on essential operations.

F.R.L.

A72-32455 # Air traffic control - The system, the problems and the possibilities. R. E. Cox (National Air Traffic Services, London, England). In: Managing to be on time: A total system approach in aircraft operations; Royal Aeronautical Society, Spring Convention, London, England, May 10, 11, 1972, Proceedings. London, Royal Aeronautical Society, 1972. 17 p.

Discussion of the duties of the National Air Traffic Services (NATS) to encourage measures which raise the potential of the airspace, such as the more competent use of better navigation systems. Constraints which arise from conflicts of interest, adjacent ATC systems, human factors, electronic system limitations, implementation time cycles, and system reliability are considered. Various navigation systems are discussed, and attention is given to all-weather operations, ground and air-to-ground communications, radar, and data processing.

F.R.L.

A72-32456 # Managing to be on time - What industry can do to help - The role of product support. R. H. Botterill (British Aircraft Corp., Ltd., London, England). In: Managing to be on time: A total system approach in aircraft operations; Royal Aeronautical Society, Spring Convention, London, England, May 10, 11, 1972, Proceedings. London, Royal Aeronautical Society, 1972. 13 p.

Review of some of the current activities by which product support can help operators to minimize delays either by direct action in flight or during turnaround at the ramp, or indirectly through supporting services. Emphasis is placed on fault isolation and reporting both in flight and during aircraft turnaround and despatch.

F.R.L.

A72-32457 # The design approach to maintainability of Concorde engines. L. S. Snell (Rolls-Royce, Ltd., London, England). In: Managing to be on time: A total system approach in aircraft operations; Royal Aeronautical Society, Spring Convention, London, England, May 10, 11, 1972, Proceedings. London, Royal Aeronautical Society, 1972. 17 p. 5 refs.

Consideration of the Concorde turbine engine proper, discussing the design approach to certain aspects of engine maintenance aimed at increased overall reliability and decreased turnaround time. Concorde engines are robust and relatively simple, e.g., there are only two turbine stages. Throughout the design care has been taken to ensure that no misassembly is feasible. Diagnostic facilities are described in detail. On-wing maintenance was one of the most pressing considerations in the design.

F.R.L.

A72-32458 # Managing to be on time - The role of the management information system. R. Morris. In: Managing to be on time: A total system approach in aircraft operations; Royal Aeronautical Society, Spring Convention, London, England, May 10, 11, 1972, Proceedings. London, Royal Aeronautical Society, 1972. 15 p.

Discussion of the management information system, which provides the 'adaptive' part of an adaptive control system which enables management to choose the hardware which needs to be

adjusted by modification or replacement, to adjust and adapt the human resources, and to modify the communications systems themselves so that performance can be improved. The principles of the RAF system, described in detail, involve (a) a unified system, standardized throughout the service, based on a single design document (the job card), and (b) the elimination of transcription. The man who originates the card creates a copy for the data center, although this is supplemented by subsequent coding processes. F.R.L.

A72-32459 # Influence of airframe design on availability. S. C. Calindi (Hawker Siddeley Aviation, Ltd., Hatfield, Herts., England). In: Managing to be on time: A total system approach in aircraft operations; Royal Aeronautical Society, Spring Convention, London, England, May 10, 11, 1972, Proceedings.

London, Royal Aeronautical Society, 1972. 38 p.

Review of the field of aircraft operational reliability from the standpoint of the aircraft designer. Advances have been made in understanding the nature of the problems contributing to unreliability which in turn should lead to significant improvements in design. It is emphasized that no one party working in isolation can produce a satisfactory solution. The way of future progress lies in the full exploitation of the working relationships between component supplier, aircraft manufacturer, and operator, working together from the earliest stages in design until all are satisfied that no further improvement can be economically justified. F.R.L.

A72-32460 # Concorde - Timesaver. E. H. Burgess and W. A. N. Ford (British Aircraft Corp., Ltd., London, England). In: Managing to be on time: A total system approach in aircraft operations; Royal Aeronautical Society, Spring Convention, London, England, May 10, 11, 1972, Proceedings.

London, Royal Aeronautical Society, 1972. 18 p.

Attempt to review the total management problem of staying on time with the Concorde. Considerable benefits have been derived from a close relationship between the potential operators and the designers. From the start of the design phase of Concorde it was the intention that, as far as possible, the aircraft should not require special treatment at the airports. The necessarily long undercarriage of the Concorde makes for some accessibility problems. The narrow fuselage entails reduced volume available for systems. Techniques are being developed for the diagnosis and onward reporting of in-flight failures. Attention is given to operations, scheduling flexibility, and arrival reliability. F.R.L.

A72-32461 # The influence of avionic equipment of aircraft timekeeping. R. W. Howard (GEC-Marconi Electronics, Ltd., Chelmsford, Essex, England). In: Managing to be on time: A total system approach in aircraft operations; Royal Aeronautical Society, Spring Convention, London, England, May 10, 11, 1972, Proceedings.

London, Royal Aeronautical Society, 1972. 19 p.

Search for possible improvements in airline timekeeping which could result from the avionics aspects by dividing the study into two major parts: in-flight operations, and aircraft unserviceability. Avionics will affect mainly the categories of weather (10%), technical and engineering (15%) and air traffic (5%). Other causes account for the remaining 70%. An all-weather landing capability should remove most of the weather delays, and the additional equipment involved should not increase the level of delays in the technical and engineering categories if the operation of the all-weather system is not 'dispatch critical.' It appears that total improvement in delays of up to 15% might be the aim for aircraft in current service if it is accepted that the proposed electronic additions are not 'dispatch critical.' In the future, fly-by-wire, CCV (Control Configured Vehicle) requirements and scheduled all weather landing will demand a change in emphasis and such elements will become 'dispatch critical.' F.R.L.

A72-32462 # 'I have a device to make all well' - Or have I. C. D. Colchester (Marconi Co., Ltd., Chelmsford, Essex, England). In: Managing to be on time: A total system approach in aircraft operations; Royal Aeronautical Society, Spring Convention, London, England, May 10, 11, 1972, Proceedings.

London, Royal Aeronautical Society, 1972. 6 p.

Discussion of the problems that arise and interfere with on-time operation of aircraft. It is pointed out that the proliferation of inventiveness has led to so many potential solutions to air traffic problems, and to so many devices intended to solve them, that difficult decisions must be made on which should be adopted. It appears that operators, nations, and manufacturers frequently present ideas which, if adopted, would be incompatible with existing systems, or might be incompatible with superior future systems. F.R.L.

A72-32571 # Interaction of electromagnetic radiation with an airplane. H. T. Chang (EG & G, Inc., Albuquerque, N. Mex.). In: Purdue Symposium on Electromagnetic Hazards, Pollution and Environmental Quality, Lafayette, Ind., May 8, 9, 1972, Proceedings.

Lafayette, Ind., Purdue University, 1972. p.

109-119. 8 refs.

A study is made of the penetration of electromagnetic waves through a conducting gasket used to protect sensitive devices in an airplane. The radius of the hatch is assumed to be very small as compared to the wavelength. The penetrated field is shown to be caused by the induced current on the gasket; a quasi-static solution is given, satisfying the boundary conditions. On a plane close to the hatch, the highest penetrated fields occur directly below the gasket ring. The maximum fields lie on a diameter parallel to the tangential component of the incident magnetic field. It was found that the field strength decreases for more than 10 dB at one radius away from the gasket. The overall shielding effectiveness indicates a range of 20 to 90 dB for various thickness and conductivities of the gasket.

A72-32610 # Current predictive models of the dynamic environment of transportation. J. T. Foley, M. B. Gens, and C. F. Magnuson (Sandia Laboratories, Albuquerque, N. Mex.). In: Environmental progress in science and education; Institute of Environmental Sciences, Annual Technical Meeting, 18th, New York, N.Y., May 1-4, 1972, Proceedings.

Mount Prospect, Ill., Institute of Environmental Sciences, 1972, p. 162-171. 31 refs. AEC-supported research.

This paper describes the current predictive models of the transportation dynamic environment which have been developed for use by Sandia Laboratories. The information sources, methods of building the models, and the method of representation are described. Advantages and limitations of the models are discussed. Suggestions are given for further work to improve the models. (Author)

A72-32612 # Environmental control system for the F-111 low temperature proof load chamber. K. W. Monroe and W. F. Mac Swain (General Dynamics Corp., Convair Aerospace Div., Fort Worth, Tex.). In: Environmental progress in science and education; Institute of Environmental Sciences, Annual Technical Meeting, 18th, New York, N.Y., May 1-4, 1972, Proceedings.

Mount Prospect, Ill., Institute of Environmental Sciences, 1972, p. 207-214.

The conduction of proof-load tests at -40 F required a unique environmental control system in order to temperature-condition an entire aircraft before, during, and after the proof test. The system used to meet the specified requirements is considered. Test requirements are discussed together with system details, giving attention to enclosure, refrigeration, heating, oxygen monitors, system controls, and accessory equipment. The environmental control system discussed made possible the early start of testing and has supported the rapid return of the F-111 aircraft to the Air Force inventory. G.R.

A72-32614 # The evolving regulatory structure of environmental noise abatement and control. L. H. Mayo and R. C. Ware (George Washington University, Washington, D.C.). In: Environmental progress in science and education; Institute of Environmental Sciences, Annual Technical Meeting, 18th, New York, N.Y., May 1-4, 1972, Proceedings. Mount Prospect, Ill., Institute of Environmental Sciences, 1972, p. 226-234. 16 refs.

The vast variety of noise sources and the basic options of abatement at the source, reduction of noise effects, or compensation for harm resulting from noise present a challenging regulatory task since choices for controlling noise in the various noise environments must be made from among a great diversity of alternative abatement strategies. Aspects of environmental noise abatement and control through private actions are discussed together with the governmental regulatory framework, the present status of regulatory efforts, and trends in noise regulation. G.R.

A72-32620 # The Aircraft Catapult Simulator. R. J. Rothaug and F. E. Gerber (Dayton T. Brown, Inc., Bohemia, N.Y.). In: Environmental progress in science and education; Institute of Environmental Sciences, Annual Technical Meeting, 18th, New York, N.Y., May 1-4, 1972, Proceedings. Mount Prospect, Ill., Institute of Environmental Sciences, 1972, p. 322-325.

It is pointed out that the arrested landing and catapult launch tests stipulated in MIL-T-7743D do not assure that store suspension equipment will meet fleet operating conditions, mainly because no facility short of an actual catapult has been available that simulates these environments. An Aircraft Catapult Simulator was designed, built, and tested in order to correct the situation. The new device simulates the physical forces associated with catapulted launches and arrested landing of an aircraft during carrier borne operation. G.R.

A72-32621 # Effect of high-intensity sound on electronic equipment and components. W. Fricke and M. V. Barsottelli (Bell Aerospace Co., Buffalo, N.Y.). In: Environmental progress in science and education; Institute of Environmental Sciences, Annual Technical Meeting, 18th, New York, N.Y., May 1-4, 1972, Proceedings. Mount Prospect, Ill., Institute of Environmental Sciences, 1972, p. 326-331. 10 refs.

Survey of literature on the effects of high-intensity sound on electronic equipment and components. Such effects must be considered when obtaining requirements of sound-proofing against intense noise fields, such as those of aircraft. A compilation of the results from noise testing of components shows that resistors, capacitors, and transistors represent the sound-insensitive category, in general. Vacuum tubes, gyros, baroswitches and relays experience detrimental changes in output when exposed to high-intensity noise or acoustically excited vibration, and are therefore classified as sound-sensitive. In particular, whisker diodes and printed circuit boards can experience irreversible damage. D.F.L.

A72-32625 # Dynamic environment study of turbojet cargo aircraft. C. F. Magnuson (Sandia Laboratories, Albuquerque, N. Mex.). In: Environmental progress in science and education; Institute of Environmental Sciences, Annual Technical Meeting, 18th, New York, N.Y., May 1-4, 1972, Proceedings. Mount Prospect, Ill., Institute of Environmental Sciences, 1972, p. 420-425. 6 refs. AEC-supported research.

The purpose of the study was to determine the dynamic input to cargo from the cargo floor in turbojet aircraft. Data were obtained during two flights on C141 aircraft and one flight on a C5A. The instrumentation, test procedures, data reduction processes, and results are discussed. The vibration of turbojet aircraft is shown to consist of near-Gaussian, wide-band random excitation with superimposed near-constant-amplitude, narrow-band 'spikes' at frequencies apparently associated with turbine imbalance, turbine airflow, and local structural natural frequencies. (Author)

A72-32631 The future of electronic displays; Proceedings of the Joint Symposium, London, England, February 23, 1972. Symposium sponsored by the Royal Aeronautical Society and Institution of Electrical Engineers. London, Royal Aeronautical Society, 1972. 47 p.

Human factor problems involved in electronic displays (ED), ED use in modern navigator-attack systems, and the views of civil helicopter pilots on ED merits are among the topics covered in papers concerned with electronic displays for military and civil aircraft. Other contributions include an appraisal of the inherent advantages and disadvantages of electronic displays and a discussion of their role in future avionics systems.

M.V.E.

A72-32632 # Electronic displays - Precision tools for the pilot. B. J. Calvert (British Overseas Airways Corp., London Airport, Hounslow, Middx., England). In: The future of electronic displays; Proceedings of the Joint Symposium, London, England, February 23, 1972. London, Royal Aeronautical Society, 1972. 3 p.

The trend toward smaller crews in smaller spaces needing larger amounts of data for more precise control of their aircraft in tasks of increasing complexity is discussed, along with the entailed need to limit at every moment the display of processed, concentrated, and selected data to those that are relevant to the task at hand. Electronic displays are expected to help meet this need, though the clarity, stability, and readability of cathode-ray tube images in cockpits are felt to need ascertainment. M.V.E.

A72-32633 # Electronic displays - Civil helicopter pilot's view. R. Williams (BEA Helicopters, Ltd., Gatwick Airport, Surrey, England). In: The future of electronic displays; Proceedings of the Joint Symposium, London, England, February 23, 1972. London, Royal Aeronautical Society, 1972. 7 p.

Information display requirements on helicopters are contrasted with those on fixed-wing aircraft, and the requirement divergences are traced to basic differences in the nature and operation of the two classes of aircraft. Interesting helicopter applications of electronic display techniques are believed possible, but contingent on thorough development efforts. M.V.E.

A72-32634 # The use of electronic displays in modern NAV/attack systems. D. E. Humphries and M. Treadgold (Royal Aircraft Establishment, Farnborough, Hants., England). In: The future of electronic displays; Proceedings of the Joint Symposium, London, England, February 23, 1972. London, Royal Aeronautical Society, 1972. 9 p.

Review of the role electronic displays play in lowering the workload of the operator to an acceptable level, and discussion of the way in which they contribute to the capability of a complete navigator-attack system. Because of the diversity of sensors used in a modern attack aircraft, each of which has a specific contribution to make to the overall effectiveness of the system, flexible electronic displays are essential if the crew are to keep abreast of rapid developments, and if they are to use their sensors to best advantage. M.V.E.

A72-32635 # The role of electronic displays in future avionic systems. W. H. McKinlay, J. M. Braid, and M. A. V. Matthews (Ferranti, Ltd., Hollinwood, Lancs., England). In: The future of electronic displays; Proceedings of the Joint Symposium, London, England, February 23, 1972. London, Royal Aeronautical Society, 1972. 13 p.

Discussion of the state of art, and of present and future trends in electronic displays, and assessment of their expansion potential in avionics systems. An effort is made to achieve a perspective in which electronic display technology is related to other technologies which

have a bearing on its adoption in real systems. Special attention is given to computer driven displays, or displays used in systems based on digital data exchange. M.V.E.

A72-32636 # Electronic displays - Wanted or wanting. R. A. Chorley (Smiths Industries, Ltd., Wembley, Middx., England). In: *The future of electronic displays; Proceedings of the Joint Symposium, London, England, February 23, 1972.* London, Royal Aeronautical Society, 1972. 8 p.

Discussion of some of the problems encountered when the adoption of electronic displays as part of a total aircraft display system is pondered. These problems are weighed against the distinctly attractive properties these displays possess. Only cathode ray tube displays are considered. M.V.E.

A72-32826 # Three-dimensional flow separations on aircraft and missiles. D. J. Peake, W. J. Rainbird, and E. G. Atraghji (National Aeronautical Establishment, Ottawa, Canada). *AIAA Journal*, vol. 10, May 1972, p. 567-580. 63 refs.

Some three-dimensional boundary-layer flow configurations for which a good understanding of the viscous flow is available are described by examples of three-dimensional separations on slender bodies, delta wings, boundary-layer diversion systems, and propulsion intake areas. Available techniques for computing interfering inviscid flowfields are reviewed, and numerous graphs and flow visualization photos illustrate flow patterns, pressure distributions, separation lines, critical angles of incidence for separation, heat transfer distributions, and effects of diverters. T.M.

A72-32827 # Jet-flapped wings in very close proximity to the ground. T. Kida and Y. Miyai (Osaka Prefecture, University, Sakai, Osaka, Japan). *AIAA Journal*, vol. 10, May 1972, p. 611-616. 14 refs.

The method of matched asymptotic expansions is applied to the problem of jet-flapped wings of finite span in very close proximity to the ground. For the linearization of this problem, the order of small parameters, the angle of attack and jet deflection, are assumed to be smaller than the ratio of the ground clearance to the root chord. This linearized problem is solved as a direct problem represented by a source distribution on the upper surface of the wing and jet sheet with concentrated sources around the leading and side edges plus a separate confined channel flow region under the wing and jet sheet. The two-dimensional, jet-flapped airfoil is examined in detail, and the calculated lift coefficients lie within 5% of corresponding results by Lissaman (1967). In the three-dimensional case, a simple analytic solution is obtained for a flat plate semielliptic wing with a straight trailing edge, zero angle of attack and uniform momentum distribution of the jet. Spanwise lift distributions and lift coefficients are derived and the distributions of the jet momentum are discussed for minimum induced drag. (Author)

A72-32885 # Determination of noise exposure around an airport. J. Igarashi and G. Nishinomiya (Japan Broadcasting Corp., Tokyo, Japan). *Tokyo, University, Institute of Space and Aeronautical Science, Report no. 476*, vol. 37, Mar. 1972, p. 53-69. 9 refs.

This paper presents a study of the noise exposure contour around an airport. The contour was figured out from the measured data obtained in the vicinity of Osaka Airport. It is compared with the calculated contour based on the data of FAA, the specified flight paths, and scheduled operations similar to those of the period of measurements. The methods of determination of PNdB, duration, and tone corrections are also mentioned, together with the relation between PNdB and dB(D) or dB(A). (Author)

A72-32886 # A free-flight support system. A. Azuma, M. Iuchi (Tokyo, University, Tokyo, Japan), B. Tomita (National Space Development Agency of Japan, Tokyo, Japan), H. Mishima, T. Iwata, and A. Komoto (Shimadzu Seisakusho, Ltd., Kyoto, Japan). *Tokyo, University, Institute of Space and Aeronautical Science, Report no. 477*, vol. 37, Mar. 1972, p. 71-104. 6 refs.

A support system for free flight of V/STOL or helicopter models is described. The support system consists of a free-flight follower and a data reduction system. The free-flight follower rests on a carriage moving on a track and supports the model in free or partly constrained flight. The flight path and attitude angles of the model during flight can be sensed with potentiometers on the support system and are recorded in oscillograms or stored in memories of a miniature computer through an A-D converter. (Author)

A72-32895 STRADA landing trajectory recording system (Le système de trajectographie d'atterrissage STRADA). J.-P. Marvillet (Direction des Recherches et Moyens d'Essais, Service des Equipements de Champs de Tir, France) and J.-L. Jouzeau (Centre de Documentation de l'Armement, Paris, France). *L'Aéronautique et l'Astronautique*, no. 35, 1972, p. 19-29. 6 refs. In French.

Developed by SECT to cover the needs of the CEV, the STRADA system should give an accurate real-time restitution of the flight path of planes during the approach and landing periods and should allow in this way the development and certification of automatic landing systems. Using the recently developed optronic techniques and the possibilities made available by the real-time computer incorporated in a measuring unit, the system consists basically of a laser radar (LIDAR) reproducing not only the distance but also the angular coordinates of a passive optical reflector the sole special device to be installed on the aircraft. Following a recall of the required performance and a general description of the STRADA system, a detailed study of the LIDAR components (turret, laser transmitter, deviation measuring receivers and telemetering), of the way of processing the data received from the LIDAR and of the function assigned to the computer is presented. It is shown how problems related to system reliability and to propagation in the atmospheric medium were solved. In conclusion, the performance and the fields of application of this optimized test facility as regards cost, efficiency and ease of operation are considered. (Author)

A72-32897 Thermal tests on aerospace structures and materials (Essais thermiques sur structures et matériaux aérospatiaux). B. Sarrette (Société Nationale Industrielle Aérospatiale, Paris, France). *L'Aéronautique et l'Astronautique*, no. 35, 1972, p. 45-52. In French.

Review of the methods and means currently employed in simulating kinetic heating of aerospace vehicles. After a brief summary of the causes of heating of aerospace vehicles and of the resulting problems a detailed account is given of the manner in which experimentation is conducted in this field. The parameters to be simulated and the simulation facilities employed are described for different types of missions ranging from supersonic flight to atmospheric reentry. A.B.K.

A72-32898 A wind tunnel for the study of subsonic flows with a periodically varying speed (Soufflerie pour l'étude des écoulements subsoniques à vitesse périodiquement variable). M. Plan, J.-M. Thomas, H. Mainardi, and S. Burnel (Orléans, Université, Orléans, France). *L'Aéronautique et l'Astronautique*, no. 35, 1972, p. 53-59. In French.

Description of a subsonic wind tunnel which produces a pulsed flow whose speed modulation law is a periodic function of time. The theoretical principle of this wind tunnel is outlined, and the structure of the wind tunnel is described in detail. The improvements obtained in comparison with conventional devices which achieve speed

modulation through periodically varying pressure losses are indicated. The results of initial tests carried out in the new wind tunnel are summarized.

A72-32899 Optimization of structures by simulation (Optimisation des structures par simulation). J. J. Audy (Société Nationale Industrielle Aérospatiale, Paris, France). *L'Aéronautique et l'Astronautique*, no. 35, 1972, p. 64-67. In French.

Brief description of an analog method of simulation developed for highly redundant structures. The proposed method is based on the electrical simulation of the structure under study, reproducing the mechanical behavior of the structure in stabilized stress states. The structure model studied is assumed to be multicellular with direct physical correspondence between each mechanical cell and the ensemble of corresponding electrical elements. The results of application of the method to the design of the Concorde SST are cited.

A72-32900 # Aerodynamic and structural noise research at NAE. R. Westley, G. M. Lindberg, Y. Y. Chan, and B. H. K. Lee (National Aeronautical Establishment, Ottawa, Canada). *Canada, National Research Council, Division of Mechanical Engineering and National Aeronautical Establishment, Quarterly Bulletin*, no. 1, 1972, p. 1-21. 43 refs.

Outline of current and proposed noise research programs encompassing a wide range of unsteady high-speed aerodynamic processes and structural response problems. Results obtained to date are briefly summarized for studies involving turbulent shear noise, shear wave instability and Mach wave radiation, wave amplification due to sound wave and jet interaction, shock cell noise, finite amplitude sound waves, jet flows in moving media, wind tunnel noise, V/STOL noise, effects of trailing vortices, atmospheric transmission patterns, and the response of stiffened panels to noise. Flow visualization photos illustrate noise propagation phenomena, and oscillograms show spectral response characteristics of panel sections.

A72-32901 # Experimental investigation of three-dimensional turbulent boundary-layer developing in a compressor cascade passage. C. L. Wakhaloo (Government Engineering College, Rewa, India). *Aeronautical Society of India, Journal*, vol. 24, Feb. 1972, p. 221-230. 26 refs. Research supported by the University of Liverpool.

Experimental-investigation of a three-dimensional turbulent boundary-layer generated on the end wall of an axial flow compressor cascade passage. The boundary layer developed under an adverse pressure gradient. Measurements were carried out in the region away from the corners formed by the blades resting on the end wall. Semilogarithmic plots of the velocity profiles in the external streamline direction exhibit a good agreement with the law of the wall. In the case of a well developed layer a wake function quite in agreement with that suggested by Coles (1956) is obtained; values of Coles' parameter exceed unity. The cross flows are not so strong. A change in the direction of transverse pressure gradient gives rise to points of inflection in the external streamlines, and 'S' shaped cross flow velocity profiles occur. Upstream and downstream of the points of inflection cross flow velocities have opposite directions.

(Author)

A72-32908 # Coupled bending bending torsion vibrations of cantilever beams. J. S. Rao (Indian Institute of Technology, Kharagpur, India). *Aeronautical Society of India, Journal*, vol. 24, Feb. 1972, p. 265-268. 10 refs.

The collocation method is used to study the coupled bending-bending torsion vibrations of a straight uniform cantilever beam with

asymmetric aerofoil cross section. Numerical results, which are based upon a solution of the differential equations, are compared with the Galerkin process. The simplicity of the collocation method over energy methods, such as the Ritz or Galerkin processes, indicates that it would be a powerful tool in the solution of turbine blade vibration problems.

A72-33010 * Non-asymptotic effects in the approach to the far field sonic boom. L. F. Henderson (Cornell University, Ithaca, N.Y.). *Zeitschrift für angewandte Mathematik und Physik*, vol. 22, Nov. 25, 1971, p. 1103-1125. 9 refs. Grant No. NGL-33-010-057.

An extension is described for the Whitham theory (1952, 1954) which indicates small deviations from the ultimate N-wave for bodies with a continuous or discontinuous tangent. Some simple formulas are derived which yield a good reduction in the sonic boom intensity. The theory is elucidated by some numerical examples for a class of simple theoretically relevant shapes.

A72-33048 VFW-Fokker's latest VTOL transport designs. I (Neue VTOL-Transportflugzeug-Entwürfe von VFW-Fokker. I). M. Lichte (Vereinigte Flugtechnische Werke-Fokker GmbH, Bremen, West Germany). *Flug Revue/Flugwelt International*, June 1972, p. 43-46, 51-54. In German.

The design specifications for the new aircraft are discussed, giving attention to the payload, the range, the runway conditions, noise, and military capabilities. Aspects of project definition are considered, taking into account fixed engine installation, retractable engines, the VC 180, and the VC 181. Questions of operational expenses and economics are also examined. A new computational approach for the determination of the operational expenses of transport aircraft had to be developed because standard procedures for conventional aircraft did not provide realistic data for the VTOL operations.

A72-33049 V/STOL weapon system VJ-101 - One-axis rocking device and suspension structure. III (V/STOL-Waffensystem VJ-101 - Einachsen-Wippe und Schwebegestell. III). H. Redemann. *Flug Revue/Flugwelt International*, June 1972, p. 66-68. In German.

It had been decided to build two purely experimental aircraft. An approach involving control with the aid of thrust changes during the hovering flight phase was considered for the VJ-101C design. Tests with a one-axis rocking device were conducted in order to obtain some practical experience for the new approach. A suspension structure was used for studies regarding the interaction of the axes in hovering flight.

A72-33113 A plan for ultra-short-haul air transportation. R. H. Miller (MIT, Cambridge, Mass.). *Technology Review*, vol. 74, June 1972, p. 22-31.

Ultrashort-haul travel, characterized by trip lengths of less than 50 miles, represents the single largest block of travel in the U.S. and is currently dominated by the automobile. It is shown that the technology of VTOL aircraft has advanced to a point where a satisfactory common-carrier air transportation system based on these vehicles may be economically viable for suburban-to-city center trips of 10 to 50 miles. Studies of a hypothetical air transport system indicate advantages of rapid access to presently congested areas at costs competitive with land-based transport. Improvements in aircraft engineering minimize problems of noise pollution, exhaust emission, dispatch reliability, and safety.

A72-33174 Handling intermodal and interline containers. G. V. Schultz. In: *International Forum for Air Cargo*, 6th, Washington, D.C., May 31-June 2, 1972, Proceedings. New York,

Society of Automotive Engineers, Inc., 1972, p. 23-32.

Usage of intermodal and interline freight containers is traced throughout the entire distribution system including warehouse storage, interfacing of different transportation modes, and distribution to local users. Emphasis is placed on the Total Pack system of intermodal unit loads and modular packaging dimensions. Package engineering considerations are examined with respect to desired aspect ratios and interlock requirements. Reasons are presented for adoption of a 54 by 45 in. intermodal unit load in the air cargo mode. T.M.

A72-33175 Terminal handling environment for noncontainerized freight. E. A. LaMarre (United Air Lines, Inc., Chicago, Ill.). In: International Forum for Air Cargo, 6th, Washington, D.C., May 31-June 2, 1972, Proceedings. New York, Society of Automotive Engineers, Inc., 1972, p. 33-37.

The importance of noncontainerized freight shipments to the air cargo industry is delineated, and specialized requirements posed by these shipments at terminal facilities are offered as an argument against the imposition of stringent uniform operating conditions at individual terminal stations. Handling procedures employed for security freight, live animals, perishables, and some types of nonperishable (hard) freight illustrate how terminals are individually keyed to the needs of their local shippers. The presently available degree of flexibility is shown to be necessary in responding to the needs of special local customers. T.M.

A72-33180 Intersociety Conference on Transportation, Washington, D.C., May 31-June 2, 1972, Proceedings. Conference sponsored by the Society of Automotive Engineers, American Institute of Aeronautics and Astronautics, American Institute of Industrial Engineers, American Society of Mechanical Engineers, Engineering Institute of Canada, Institute of Electrical and Electronics Engineers, and Operations Research Society of America. New York, Society of Automotive Engineers, Inc., 1972. 269 p. Members, \$18.75; nonmembers, \$25.

Passenger and cargo transportation systems are examined in a series of papers dealing with planning and forecasting procedures, special problems encountered in high-density urban areas, efficient linkage of different forms of transport at terminal areas, VTOL short-haul operations, and control measures in the transportation industry. The unique capabilities of heavy-lift helicopters in solving difficult transportation and construction problems are demonstrated along with potential applications of flexible wings in transport and emergency situations. The economic feasibility of VTOL transit between suburbs and central city areas is seen as a possible solution to heavy automobile traffic in congested regions. T.M.

A72-33181 A status report on VTOL short-haul systems. M. W. Hellyar (United Aircraft Corp., Sikorsky Aircraft Div., Stratford, Conn.). In: Intersociety Conference on Transportation, Washington, D.C., May 31-June 2, 1972, Proceedings. New York, Society of Automotive Engineers, Inc., 1972, p. 229-236.

This paper traces the evolution of the VTOL short-haul concept from its origins in 1967 to the present. It shows how design proposals have become more responsive to the evolving system and economic requirements of the potential operating airlines. For example, Sikorsky is preparing a two-phase program beginning with the readily available 46-passenger S-65-40 helicopter, and followed by introduction of the 100-passenger S-200 compound aircraft in 1980. The VTOL market potential is discussed, as is projected acceptance of the VTOL short-haul system in the Northeast Corridor and the principal routes of western Europe. (Author)

A72-33182 * Flexible wings for transportation. F. M. Rogallo, D. R. Croom, and W. C. Sleeman, Jr. (NASA, Langley Research Center, Hampton, Va.). In: Intersociety Conference on Transportation, Washington, D.C., May 31-June 2, 1972, Proceedings. New York, Society of Automotive Engineers, Inc., 1972, p. 237-247. 115 refs.

The possible uses of flexible wings for transportation of passengers and cargo from point to point on earth are discussed along with emergency applications of flexible wings in connection with conventional aircraft. Topics considered include gliding and soaring as a sport, towing of flexible-wing gliders for cargo delivery, powered flight with small aircraft having folding flexible wings, aerial dropping of personnel and cargo on flexible wings instead of parachutes, landing and recovery of rocket payloads by means of flexible wings, and use of flexible wings with ejection seats and as an emergency landing system for conventional aircraft. T.M.

A72-33183 * Some applications of buoyancy systems and parawings to replace conventional and proposed transportation systems. C. D. Havill and L. J. Williams (NASA, Washington, D.C.). In: Intersociety Conference on Transportation, Washington, D.C., May 31-June 2, 1972, Proceedings. New York, Society of Automotive Engineers, Inc., 1972, p. 248-254. 10 refs.

An exploratory study has been conducted to assess the performance potential of buoyant airships and parawings in short-haul passenger transportation. Results show that such systems can be used effectively, from a performance standpoint, in a VTOL or STOL mode of operation. A supplementary assessment of potential applications of such vehicles is examined, with a brief look at economic factors and an examination of missions for which they might be effectively used. (Author)

A72-33184 Civil applications of the air cushion landing system. D. H. Grupe (Bell Aerospace Co., Buffalo, N.Y.). In: Intersociety Conference on Transportation, Washington, D.C., May 31-June 2, 1972, Proceedings. New York, Society of Automotive Engineers, Inc., 1972, p. 255-259. 5 refs.

This paper will provide a brief history of the development of the air cushion landing system, including the present U.S. Air Force/Canadian Department of Industry, Trade, and Commerce advanced development program to equip a DeHavilland CC-115 Buffalo airplane with an air cushion landing system. The operation, braking, and parking of the air cushion landing system will be explained. The advantages of this type of landing system over conventional wheeled landing gear will be examined in relation to civil aircraft applications such as high density, low density short haul transportation systems, and STOL operations. The effect of ACLS on airport design, safety, environmental factors, and potential weight saving will be discussed. It is concluded that the development of the ACLS is an aeronautical technology that will result in a benefit to civil aircraft transportation. (Author)

A72-33185 The role of the heavy lift helicopter. E. E. Gustafson (United Aircraft Corp., Sikorsky Aircraft Div., Stratford, Conn.). In: Intersociety Conference on Transportation, Washington, D.C., May 31-June 2, 1972, Proceedings. New York, Society of Automotive Engineers, Inc., 1972, p. 260-265.

Current and anticipated applications of the S-64 Skycrane helicopter in commerce and industry are described to illustrate its unique potential of solving difficult transportation and construction problems. Examples considered include logging operations in ecologically sensitive or rugged areas, bridge construction, dike building, transfer of cargo to building rooftops, transport and erection of towers for electric powerlines, supply and delivery to remote oil drilling operations, ship-to-shore transfer of cargo, and delivery of prefabricated housing units. T.M.

A72-33221 The challenge for new structural test methods. K. C. Mard (United Aircraft Corp., Sikorsky Aircraft Div., Stratford, Conn.). *Materials Research and Standards*, vol. 12, June 1972, p. 21-25, 55, 56.

The helicopter manufacturer is being motivated to reduce the cost of testing by employing new test methods. To meet this challenge at Sikorsky Aircraft, a comprehensive effort is being made to seek out activities that are unnecessarily costly and to stimulate ideas for minimizing these costs. Several examples of cost-saving techniques are given, including an analytical method for establishing replacement times of components subjected to fatigue, finding alternatives to constraints on testing such as that caused by weather, use of simulated system tests, use of computer hardware to expedite test engineering evaluation and decisioning, and effective control of data quality and quantity requirements. Significant cost and calendar time savings are projected for major development programs. (Author)

A72-33229 # Studies on the gust response of a wing. II. H. Maeda (Kyoto University, Kyoto, Japan) and M. Kobayakawa (Kansai University, Osaka, Japan). *Kyoto University, Faculty of Engineering, Memoirs*, vol. 33, Oct. 1971, p. 343-367. 5 refs.

The deformations of a two-dimensional elastic wing caused by gusts were separated into two types connected with the bending mode and the torsional mode. The gusts investigated include the sinusoidal gust and the random gust. In the case of a sinusoidal gust, the modes of deformation were studied both theoretically and experimentally. In the case of the random gust, the power spectral functions and the frequency transfer functions were obtained experimentally. The frequency transfer functions obtained by theoretical calculations were compared with the experimental values.

A72-33244 Digital attitude and heading reference system. D. R. Brickner (Sperry Rand Corp., Sperry Flight Systems Div., Phoenix, Ariz.). *Sperry Rand Engineering Review*, vol. 24, no. 4, 1971, p. 23-27.

Description of a new all-attitude attitude and heading reference system (AHRS) which makes use of solid-state techniques in the data format conversion and the heading control functions. The AHRS computer is a 16-bit parallel organization utilizing 16 general registers in a two's complement arithmetic processor. The AHRS computer including all input/output and memory functions is packaged on four multilayer printed circuit boards. The computer consumes approximately 35 watts of power, utilizes 43 cubic inches, and weighs 1.8 pounds. The computer provides heading and attitude angles in digital form, gyroscopic erection control, and heading slaving control. The AHRS program is completely executed 75 times per second. Roll data are updated 300 times per second with pitch and heading updates at 75 times per second.

A.B.K.

A72-33245 Avionics computer for ASW. W. D. Marth and E. F. Melin (Sperry Rand Corp., Univac Div., St. Paul, Minn.). *Sperry Rand Engineering Review*, vol. 24, no. 4, 1971, p. 28-34.

Description of a multiprocessor computer designed to meet the extremely high data processing requirements of airborne antisubmarine warfare (ASW). The Univac 1832 computer is composed of two central processors, two input/output controllers (IOCs), two input/output interfaces (IOIs), two 32,000-word memory units, a power supply, and space for an additional 32,000-word memory unit. The computer's electronics include integrated circuit flatpacks and high-density medium-scale integrated circuits that meet military requirements. Logic cards and power converters are housed in easily maintainable drawer units. The computer's random access memory is also packaged in drawers. The central processors are capable of handling both fixed- and floating-point arithmetic. The most important functional feature of the 1832 computer is its shared memory. Each memory bank has accessing ports for six user units. Each IOI connects to both IOCs and provides the controllers with

their external interface. Each IOC operates independently of the other and interfaces with each processor and memory bank, allowing the IOC to be initiated and controlled by either processor and to access to any memory bank.

A.B.K.

A72-33246 Loran-inertial data processing. G. C. Erkmann and S. G. Rogich (Sperry Rand Corp., Great Neck, N.Y.). *Sperry Rand Engineering Review*, vol. 24, no. 4, 1971, p. 35-40.

Description of a recently developed loran/inertial-aided weapon delivery system for fighter bombers. The system described uses a dedicated computer to combine the functions of navigation, guidance, and weapon delivery into a fully integrated system. The optimal mixing of loran and inertial parameters eliminates the need for recalibration and provides accurate position data at all times. Continuous computation of weapon impact range allows evasive maneuvers up to and through the moment of weapon release. The result is a highly accurate, all-weather navigation, guidance, and weapon delivery system requiring fewer pilot operations than ever before.

A.B.K.

A72-33299 Thermomechanical processing of nickel-base alloys. B. H. Kear, J. M. Oblak, and W. A. Owczarski (United Aircraft Corp., Pratt and Whitney Aircraft Div., East Hartford, Conn.). *Journal of Metals*, vol. 24, June 1972, p. 25-32. 17 refs.

Potentially, the most promising application for the thermomechanical treatment (TMT) of nickel-base alloys is in the fabrication of components such as disks or shafts in aircraft gas-turbine engines. The maximum service temperature for such components does not exceed that where creep becomes a serious problem. Impressive progress has been made in the TMT processing of gamma prime precipitation hardened nickel-base alloys. The most striking advances in the state of the art have been made in the hot working area, where the conditions have been specified for obtaining superplastic-type behavior in several alloys by conventional forging, and for its utilization in the fabrication of fairly complex, massive shapes.

A72-33306 Air Transportation Conference, Washington, D.C., May 31-June 2, 1972, Proceedings. Conference sponsored by the Society of Automotive Engineers, American Institute of Aeronautics and Astronautics, and American Society of Mechanical Engineers. New York, Society of Automotive Engineers, Inc., 1972. 79 p. Members, \$12.75; nonmembers, \$15.75.

Economic and technological aspects of modern air transportation are discussed, covering airport-community relations, airport neighborhood reactions, area survey, airport construction economics, and air service demand forecasting. The topics also include the impact of O'Hare International Airport on Chicago, short-haul transportation issues, air transport propulsion systems, and the contribution of advanced aircraft engines to air transportation progress.

V.Z.

A72-33307 Construction economics and community impact. E. E. Dean. In: *Air Transportation Conference, Washington, D.C., May 31-June 2, 1972, Proceedings*. New York, Society of Automotive Engineers, Inc., 1972, p. 1-9.

A discussion of construction economics and community impacts of the new Dallas/Fort Worth Airport is presented. Planning and design criteria and a description of construction of the airport development are presented and serve as a background for the information pertaining to economics and related community impacts. To evaluate the economic effect of construction, two plots are presented and analyzed. The first plot pertains to the commitments and cash flow of construction funds as a function of time. The second plot pertains to the number of construction personnel on the

airport site as a function of time. Personnel levels and the construction costs are used as a basis for analyzing the impact on the economy of communities served by the airport. It is concluded that the construction of new, large scale airports has major impacts on the economy and life style of communities in the vicinity of the airport. (Author)

A72-33308 The airport environment - Economic impact on the community. G. Howard (Port of New York Authority, New York, N.Y.). In: Air Transportation Conference, Washington, D.C., May 31-June 2, 1972, Proceedings. New York, Society of Automotive Engineers, Inc., 1972, p. 10-16. 8 refs.

Economic studies which have attempted to identify and quantify the benefit of an airport to the regional economy are surveyed. Such studies have not, for the most part, attempted to evaluate the economic dependency of industry on air transportation. The benefits of air transportation cannot be adequately assessed simply by the multiplier effect or input-output analysis. Environmental studies such as those done by the Commission on the Third London Airport and by the National Academy of Sciences on the extension of Kennedy Airport into Jamaica Bay have been most comprehensive in their analysis of environmental costs. The decision to build a new airport or expand an existing one is an increasingly difficult one, involving a complex mixture of institutional, environmental and economic issues. This makes it all the more imperative for the evaluators of these major public projects to give full weight to all the identifiable benefits and costs so that planning decisions can be made rationally with full knowledge of the consequences.

(Author)

A72-33309 Area survey of airport environs economic reactions - Present and future. G. J. Bean (Hillsborough County Aviation Authority, Tampa, Fla.). In: Air Transportation Conference, Washington, D.C., May 31-June 2, 1972, Proceedings. New York, Society of Automotive Engineers, Inc., 1972, p. 17-24. 21 refs.

Past impact of the airport on the community can readily be measured through analysis of historic economic data which has been assembled in the individual community. Measurement of present economic impact involves the overlaying of airport growth data on that of the general community surrounding the airport. Measurement of future airport economic impact on its environs must deal in large part with the intangible qualities of surveys and forecasts relating to the community's continued development. The highest degree of direct economic support given to the community starts within the airport itself. The secondary level of economic impact covers those areas directly adjoining the airport, and finally, the impact can be measured in terms of the airport's interplay with the community, expressed as the entire trade which the airport serves. (Author)

A72-33310 * Problems and issues for short-haul air transportation. J. F. Vittek, Jr. (MIT, Cambridge, Mass.). In: Air Transportation Conference, Washington, D.C., May 31-June 2, 1972, Proceedings. New York, Society of Automotive Engineers, Inc., 1972, p. 32-36. NASA-sponsored research.

The problems of developing an efficient short-haul air system are not primarily technical, but economic and political. The key issues are whether the community will accept new and expanded air facilities, what standards of service the passengers will demand and how the system will evolve. The solutions recommended are national in scope and require the federal government to take a leading role.

(Author)

A72-33311 Forecasting air service demand. G. W. James (Air Transport Association of America, Washington, D.C.). In: Air Transportation Conference, Washington, D.C., May 31-June 2, 1972, Proceedings. New York, Society of Automotive Engineers, Inc., 1972, p. 37-40.

In 1967 the airline industry embarked on a new forecasting project (an Airport Demand Forecast Study) to determine future traffic demands at individual airports as well as future nationwide air traffic. The study, involving many complex problems, has recently been completed. It will be used for airport planning purposes at major hubs across the country. The study forecasts demand far enough into the future to enable needed airport developments to be accomplished in time. (Author)

A72-33312 The airport - A center of economic gravity. J. A. Foster (Houston, Dept. of Aviation, Houston, Tex.). In: Air Transportation Conference, Washington, D.C., May 31-June 2, 1972, Proceedings. New York, Society of Automotive Engineers, Inc., 1972, p. 41-48. 12 refs.

The airport as an instrumentality of air transport services performs a function of substantial economic importance to the community and country it serves. It provides the facility that gives business and industrial communities access to a national and international air transport network that links cities and nations together. The economic impact of a major airport, both on neighboring real estate values and on the economy of the communities it serves, is quite substantial. An active commercial airport truly becomes a center of economic gravity within its market area.

(Author)

A72-33313 The development of propulsion systems for air transport. H. Pearson (Rolls-Royce, Ltd., Derby, England). In: Air Transportation Conference, Washington, D.C., May 31-June 2, 1972, Proceedings. New York, Society of Automotive Engineers, Inc., 1972, p. 49-61.

The paper briefly reviews the evolution of modern aero engines and analyses the forces which motivate continued technical development, especially the interaction with growth in traffic and aircraft size. The contribution of improved propulsion systems to the economics and regularity of air transport are examined with particular reference to developments during the past decade. There is some discussion of the environmental factors (particularly noise) raised by civil aviation, the progress already made to deal with them, and the possibilities for the future. The overall benefits of power-plant technical development particularly as they affect the general and travelling public are summarised.

(Author)

A72-33314 How will new engines contribute to better air transportation. R. C. Mulready and R. L. Staubach (United Aircraft Corp., Pratt and Whitney Aircraft Div., East Hartford, Conn.). In: Air Transportation Conference, Washington, D.C., May 31-June 2, 1972, Proceedings. New York, Society of Automotive Engineers, Inc., 1972, p. 62-67.

Engine technology has played a major role in establishing today's modern commercial transport aircraft as a vital part of the world transportation system. This paper discusses the significant advancements that have been made in air transportation and the contribution the engine has made to these advancements. Potential future improvements that could benefit the customer, community and operator are examined and new transport aircraft and engine possibilities indicated. The concern over the social and ecological compatibility of air transportation with the community will be a significant factor in future transport aircraft and engine design requirements. The impact of these demands on new engines and advanced technology requirements will be discussed. (Author)

A72-33315 Aircraft engines - A vanguard of air transportation progress. E. E. Hood, Jr. (General Electric Co., Commercial Engine Div., Cincinnati, Ohio). In: Air Transportation Conference, Washington, D.C., May 31-June 2, 1972, Proceedings. New York, Society of Automotive Engineers, Inc., 1972, p. 68-76.

The impact of the gas turbine on safety, reliability, and airline profitability; impact of the jet aircraft on international trade and development; new aircraft engines beget new and more productive airplanes; new technology has enhanced air transportation progress; and air transportation progress is benefitting the airlines; national interests, and all in our society, including the neighbors of our airports. A72-33326 Civil Aviation Safety Centre, Annual Technical Conference, 6th, Beirut, Lebanon, November 30-December 3, 1971, Final Report. Beirut, Civil Aviation Safety Centre, 1971. 285 p.

General topics of airport planning and management are covered in papers dealing with design of terminal areas, acquisition of airport facilities, choice of suitable aircraft to satisfy realistic operational requirements, special problems in underdeveloped countries, the role of STOL operations, financing, and international cooperation in civil aviation. Factors affecting the design of boarding areas, surface transit links, cargo handling systems, and safety devices are identified along with various planning and forecasting methods employed for future needs. Manpower training is discussed, and international assistance programs conducted by ICAO are described.

T.M.

A72-33327 # The elements of planning necessary for the development of a major civil airport. J. A. Foster. In: Civil Aviation Safety Centre, Annual Technical Conference, 6th, Beirut, Lebanon, November 30-December 3, 1971, Final Report. Beirut, Civil Aviation Safety Centre, 1971. 24 p.; Discussion. 1 p. 49 refs.

Discussion of essential planning data required for the preparation of a comprehensive and graphic master plan of development for a major civil airport. Information gathering and processing methods are described for conducting forecasts of aviation demand, forecasts of aircraft movements, estimates of airport earning capability vs costs, forecasts of gross revenues and expenses, and evaluations of airport pricing policies. Experience gained with the planning of the Houston Intercontinental Airport is reviewed to illustrate practical countermeasures for specific development problems.

T.M.

A72-33328 # Various master plan solutions, concept for the various areas, 'STOLports.' J. Bachelez (Paris Airport Authority, Paris, France). In: Civil Aviation Safety Centre, Annual Technical Conference, 6th, Beirut, Lebanon, November 30-December 3, 1971, Final Report. Beirut, Civil Aviation Safety Centre, 1971. 33 p.; Discussion. 3 p.

The preparation of a master plan of development for a major civil airport is examined in terms of (1) factors governing the choice of a suitable site and (2) objectives which should be met by the location, the dimensions, and the arrangement of the various installation areas covered in the master plan. Attention is given to traffic forecasts, number and orientations of runways, assessment of noise disturbances, airspace capacity, access systems, freight installations, maintenance facilities, navigation aids, control towers, technical and administrative buildings, and STOL ports.

T.M.

A72-33329 # Design factors - Passenger and cargo terminals and associated handling areas. E. B. Tutty (International Air Transport Association, Montreal, Canada). In: Civil Aviation Safety Centre, Annual Technical Conference, 6th, Beirut, Lebanon, November 30-December 3, 1971, Final Report. Beirut, Civil Aviation Safety Centre, 1971. 15 p.; Discussion. 3 p.

The design and layout planning of a passenger terminal complex in a major civil airport are examined in terms of systems and flow routes intended to facilitate and shorten the beginning or the end of a journey by air. Requirements and guidelines are given for the

design of the interface with surface transit systems, check-in facilities, government control areas, information centers, baggage handling systems, passenger loading bridges, gate lounges, and electronic equipment. Aircraft parking aprons and required aircraft maneuvers are considered together with cargo handling facilities. T.M.

A72-33330 # FAA airport certification programme. J. S. Jamison (FAA, Washington, D.C.). In: Civil Aviation Safety Centre, Annual Technical Conference, 6th, Beirut, Lebanon, November 30-December 3, 1971, Final Report. Beirut, Civil Aviation Safety Centre, 1971. 9 p.; Discussion. 3 p.

Description of the policy followed by the FAA in issuing airport operating certificates and in establishing minimum airport safety standards. Airport certification is shown to be conditional on the presentation of a satisfactory airport operations manual, a program of self-maintained inspection, a plan to be followed in specific emergency situations, proof of fire-fighting and rescue equipment, proper handling and storage of hazardous materials, orderly operation of ground vehicles, marking and lighting of runways, protection of navigation aids, protection of the public, and other factors. T.M.

A72-33331 # The development of the STOL concept and its future applications. E. H. Childs (British Airports Authority, London, England). In: Civil Aviation Safety Centre, Annual Technical Conference, 6th, Beirut, Lebanon, November 30-December 3, 1971, Final Report. Beirut, Civil Aviation Safety Centre, 1971. 9 p.; Discussion. 2 p.

Efficient utilization of STOL aircraft capabilities for civil transport applications is discussed from the viewpoints of optimum aircraft design concepts, noise reduction measures, and terminal facility requirements. Potential uses of STOL aircraft in supplementing existing airports, providing service to smaller cities, and distributing air traffic throughout large urban areas are used to define optimum specifications for terminal locations, runway length, surface transit connections, and scheduling operations. T.M.

A72-33332 # Factors affecting growth of civil aviation in developing countries. S. Medhane (Ethiopian Airlines, S.C., Addis Ababa, Ethiopia). In: Civil Aviation Safety Centre, Annual Technical Conference, 6th, Beirut, Lebanon, November 30-December 3, 1971, Final Report. Beirut, Civil Aviation Safety Centre, 1971. 11 p.; Discussion. 3 p.

Economic growth and future welfare of underdeveloped nations are shown to be strongly dependent on the establishment of efficient civil aviation, and special problems faced by airlines in these countries are outlined. Factors governing the evolution of airlines are identified with a realistic assessment of the role to be played, proper allocation of funds by governments, credibility in the international money markets, sufficient skilled manpower, suitable equipment, realistic fare structures, expansion of tourist travel, and interline cooperation. T.M.

A72-33333 # Factors in the selection of aircraft equipment. R. P. Norton (Boeing Co., Renton, Wash.). In: Civil Aviation Safety Centre, Annual Technical Conference, 6th, Beirut, Lebanon, November 30-December 3, 1971, Final Report. Beirut, Civil Aviation Safety Centre, 1971. 13 p.; Discussion. 3 p.

The selection of aircraft for use by commercial airlines is discussed in terms of proper evaluation of technical data and information offered by the manufacturer to a prospective customer. Attention is drawn to the need for distinguishing among operational objectives of profit, national development, promotion of tourism, or maintenance of international balance of payments. The choice among large, small, or medium size aircraft of short, intermediate, or long range capability is shown to be affected by economics, traffic forecasts, runway quality, maintenance and operating costs,

reliability, and cargo handling options. Route analysis and fleet planning are discussed, along with aspects of mutual airline support.

T.M.

A72-33373 # Assembly of aircraft engines /2nd revised and enlarged edition/ (Sborka aviatsonnykh dvigatelei /2nd revised and enlarged edition/). V. N. Belikov and A. N. Nikitin. Moscow, Izdatel'stvo Mashinostroenie, 1971. 236 p. 27 refs. In Russian.

Aircraft engine assembly operations are described in terms of process schedules, definition of assembly phases, organization of work areas, factors affecting precision, types of elements (joints and couplings) involved, and quality control measures. Static and dynamic balancing of machine elements is discussed, together with concepts of total and partial interchangeability of replacement elements. Bearings, press fittings, rivet and bolt joints, welded joints, and adhesive bonding are treated, along with special procedures to be followed in the assembly of specific parts in turbine engines and spacecraft rocket engines.

T.M.

A72-33374 The effect of regulation on the cost performance and growth strategies of the local service airlines. G. Eads. *Journal of Air Law and Commerce*, vol. 38, Winter 1972, p. 1-34. 50 refs.

It is shown that the performance of local service carriers has fallen short of the goals set by the Civil Aeronautics Board when this carrier group was established in the 1940s. The failure is attributed mostly to faulty government regulation. It is shown that the quality and quantity of airline service provided to the smaller communities has deteriorated over the last ten years, while the cost to the federal government of providing this service has increased. Of the options which the government now has, preference is given to the option of permitting the CAB to try a new scheme of subsidization involving competitive bidding for the right to provide stated quantities of service. Superior service at substantially lower cost is expected from this step, but pitfalls which may prevent such a scheme from working in practice are pointed out.

V.P.

A72-33375 The Brazilian experiment in the creation of an aircraft industry. B. M. Carl. (Southern Methodist University, Dallas, Tex.). *Journal of Air Law and Commerce*, vol. 38, Winter 1972, p. 35-51. 76 refs.

The methods employed in Brazil to finance the creation of a domestic aviation industry are examined. In structuring its development laws, Brazil adopted a unique approach of 'mixed-economy' corporations. By this blend of public and private ownership, coupled with foreign and domestic technology and a system of tax incentives designed to assist in obtaining adequate capitalization, Brazil hopes to overcome the economical and technical obstacles to the achievement of an industry competitive in the world market. If successful, the Brazilian venture may serve as a model for other countries in their economic development.

A72-33401 The wave formation and sonic boom due to a delta wing. K. Oswatitsch and Y. C. Sun (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für theoretische Gasdynamik, Aachen, West Germany). *Aeronautical Quarterly*, vol. 23, May 1972, p. 87-108. 17 refs.

Investigation of the influence of near-field flow on the far-field wave formation for an incident flat delta wing with supersonic leading edges, employing the analytical method of characteristics and a limiting procedure suitable for dealing with the trailing-edge expansion. Though confined in its scope to the front shock in the vertical plane of symmetry of the wing and to a homogeneous atmosphere without density and temperature gradients, the present analysis reveals features of flow which are interesting from the

standpoint of the general theory of three-dimensional supersonic flow. It is found that the front shock due to a delta wing will as a rule be canceled at a finite distance from the wing by the plane-wave expansion emanating from the trailing edge. The overexpansion must then give rise to a rear shock separate from the front one. Thus, at least in the plane of symmetry, a sharp-front wave signature cannot, in general, be expected from the wing at a distance beyond the terminating point of the front shock. The boom signature will then be qualitatively different from that of a body of revolution. (Author)

A72-33403 The flow in S-shaped ducts. P. Bansod (City University, London, England) and P. Bradshaw (Imperial College of Science and Technology, London, England). *Aeronautical Quarterly*, vol. 23, May 1972, p. 131-140. 16 refs.

Measurements are presented of total pressure, static pressure, surface shear stress and yaw angle in the flow through several S-shaped ducts, each with a thin turbulent boundary layer at entry. The results show that the region of low total pressure in the exit plane, found by previous workers, is due to expulsion of boundary-layer fluid by a pair of contra-rotating vortices in the boundary layer. The generation of these vortices is explained: similarly-produced vortices, with similar effects, occur in some types of wind-tunnel contraction and possibly in other three-dimensional flows. (Author)

A72-33404 The impact of an axisymmetric jet onto a normal ground. L. J. S. Bradbury (Surrey University, Guildford, Surrey, England). *Aeronautical Quarterly*, vol. 23, May 1972, p. 141-147. 5 refs.

The impact of an axisymmetric jet onto a ground board is a flow of some interest in VTOL aircraft aerodynamics. This paper presents a simple argument for correlating data obtained in the impact region from different nozzle configurations and for different nozzle heights above ground. The argument is applied, in particular, to the static pressure on the ground board and to the peak dynamic head in the flow over the ground board. (Author)

A72-33409 # Calculation of the natural frequencies and modes of vibration of a free glider (Obliczanie czestosci i postaci drgan wlasnych swobodnego szybowca). M. Nowak. *Archiwum Budowy Maszyn*, vol. 19, no. 2, 1972, p. 283-299. 12 refs. In Polish.

The proposed method of calculating the natural frequencies and modes of vibration of a free material system differs from other widely used methods in that it reduces the calculation to an eigenvalue problem of a symmetrical matrix. Example calculations of the vibrations of a free glider are used to demonstrate useful procedures for replacing a complex three-dimensional structure by an approximate model of a system with a finite number of degrees of freedom.

A72-33423 Improvement of the flight characteristics for the landing approach by the coupling of spoiler and elevator deflection (Verbesserung der Flugeigenschaften im Landeanflug durch Kopplung von Spoiler- und Höhenruderausschlag). G. Sachs (Darmstadt, Technische Hochschule, Darmstadt, West Germany). *Zeitschrift für Flugwissenschaften*, vol. 20, May 1972, p. 194-204. 11 refs. In German.

The effects of the coupling of spoiler and elevator deflection on the behavior of airplanes (pitch, flight-path angle, speed) are presented whereby an intended delay of the spoiler displacement is included in the investigations. The coupling yields a considerable increase of the quasi-steady load factor, and flight path response characteristics can be improved. This is especially important for the landing approach. Corresponding to the direct effect on lift caused by the spoiler deflection, the method simultaneously has the character of a direct lift control. Furthermore, it is possible to eliminate the problem of speed instability which denotes the control

difficulties at speeds below the speed of minimum drag. Consequently, restrictions resulting from the flight path stability requirement can be removed. Contrary to flaps which also can be used for the coupling with the elevator, in the case of spoilers, the drag changes are combined with the lift changes in such a manner that they essentially contribute to the solution of the problem of speed instability. (Author)

A72-33500 The fog dispersal problem in the United Kingdom. G. H. Forster. London, Civil Aviation Authority, 1972. 18 p.

The current state of fog dispersal efforts in the United Kingdom is discussed, covering their history, fog dispersal progress since World War II, fog conditions at London airports, vast expenditures in 1971 in the U.S., and the incidence of fog vs traffic. Cost analysis projection is given for a complementary fog dispersal system, involving chemical seeding with laser and lidar remote sensing instruments as substitutes for a less effective radar technique. V.Z.

A72-33501 Selecting a basic flight procedure trainer. R. P. Terry (Oxford Air Training School, Oxford, England). *Shell Aviation News*, no. 406, 1972, p. 8-11.

The criteria employed in the selection of the flight trainer are discussed together with the available models taken into consideration. As a result of the investigation it was decided to evaluate the Model 101-G of Frasca Aviation. The trainer incorporates a model aircraft positioned in the student's line of sight. Various adjustments were made to adapt the trainer to the particular requirements involved. The various aspects in the employment of the Model 101-G as a teaching tool are examined. G.R.

A72-33521 # New generation distance measuring equipments. D. Graziani (Face Standard, Milan, Italy). *Electrical Communication*, vol. 47, no. 2, 1972, p. 113-116. 7 refs.

The success of new ground-based distance measuring equipment (DME) depends mainly on the extensive use of solid state devices, new logic circuits, and increased reliability. A DME receiver is described that uses a strong, instantaneous, automatic gain control on the IF amplifier. This control is capable of reducing the gain by at least 60 dB, thus allowing full sensitivity of the ground receiver to be restored a few seconds after reception of a strong signal. The ground beacon uses a full band power amplifier that is a single, compact module capable of delivering a peak power of more than 2 kW. With a view toward improving distance accuracy of next generation DME that are used for landing, several improvements are suggested. These include full solid state equipment, new shape of the transmitted pulses, automatic control, and first pulse detection. D.F.L.

A72-33525 The Boeing 747 is not immune against clear air turbulence. E. R. Reiter and W. R. Green (Colorado State University, Fort Collins, Colo.). *Archiv für Meteorologie, Geophysik und Bioklimatologie, Serie A - Meteorologie und Geophysik*, vol. 21, no. 1, 1972, p. 27-34.

Upper-air analyses are presented for a case of strong turbulence, presumably CAT, that befell a Boeing 747 on November 4, 1970, near Nantucket Island. Although there were thunderstorms in the vicinity, the main cause for the incident appeared to have been shear-generated turbulence typical of CAT. It is pointed out that it is due to the airworthiness of the B-747 and to the alertness of its crew that a major disaster could be averted. G.R.

A72-33539 Green light for Autoland. H. Field. *Flight International*, vol. 101, June 8, 1972, p. 838-842.

The ultimate goal of Autoland development is clearance for its

operations in Cat 3b weather conditions. No further development of the system is required in order to reach this goal. However, comprehensive data demonstrating system reliability are to be acquired. Every Trident 3B carries as part of the ship's library a 64-channel cassette recorder, and every Autoland is automatically analyzed. An in-service program of 5,000 recorded approaches has been called for before the approval will be granted to operate in Cat 3b. G.R.

A72-33600 Probabilistic assessment of aircraft hazard for nuclear power plants. C. V. Chelapati (California State College, Long Beach; Holmes and Narver, Inc., Los Angeles, Calif.), R. P. Kennedy (Holmes and Narver, Inc., Los Angeles, Calif.), and I. B. Wall (General Electric Co., Atomic Power Equipment Dept., San Jose, Calif.). (*International Conference on Structural Mechanics in Reactor Technology*, 1st, Berlin, West Germany, Sept. 20-24, 1971.) *Nuclear Engineering and Design*, vol. 19, no. 2, 1972, p. 333-364. 41 refs.

An analysis is made of aircraft accidents to establish the probability of an aircraft striking a nuclear power plant and the frequency distribution for aircraft. Various empirical perforation formulas and the development of a new empirical formula for the determination of perforation thickness are discussed. Using the Monte Carlo method and yield line theory, respectively, the probability of perforation and the probability of collapse mode of damage is determined. Finally, the cracking mode of damage is discussed using elastic theory and finite-element idealization. O.H.

A72-33609 An instrument for the automatic control of speed in low-speed wind tunnels. T. Robertson and J. G. Burns (Edinburgh, University, Edinburgh, Scotland). *Journal of Physics, Part E - Scientific Instruments*, vol. 5, June 1972, p. 598-600. Research supported by the Science Research Council.

The frequency of eddy shedding by a circular cylinder at constant Strouhal number is shown to be suitable for the measurement of flow velocity in wind tunnels. A wind speed monitor and regulator designed on this principle for an on-line experiment has operated successfully at speeds ranging from 4 to 20 m/sec, and the system is adaptable also to other speed ranges. M.V.E.

A72-33627 Aircraft landing measurement system. N. P. Robinson (Marconi-Elliott Avionic Systems, Ltd., Rochester, Kent, England). In: *International Aerospace Instrumentation Symposium*, 7th, Cranfield, Beds., England, March 20-23, 1972, Proceedings. Stevenage, Herts., England, Peter Peregrinus, Ltd., 1972, p. 1.1-1.8.

Description of an aircraft landing measurement system (A.L.M.S.) providing a computer analysis for air traffic landing at a major civil airport. The system uses groups of optical, seismic and IR sensors for landing aircraft performance measurement, and a central processor unit for data recording on punched paper tapes. A preliminary assessment of the system is given. V.Z.

A72-33628 An integrated system of airborne and ground-based instrumentation for flying qualities research with the X-22A airplane. J. L. Beilman (Cornell Aeronautical Laboratory, Inc., Buffalo, N.Y.). In: *International Aerospace Instrumentation Symposium*, 7th, Cranfield, Beds., England, March 20-23, 1972, Proceedings. Stevenage, Herts., England, Peter Peregrinus, Ltd., 1972, p. 2.1-2.12.

This paper considers the use of an integrated system of airborne ground-based instrumentation used for flying qualities research with the X-22A, a VSTOL airplane specifically designed to be a variable stability airplane. It discusses several unique features of the X-22A airplane as well as the telemetry system, the mobile instrumentation van and its equipment, landing aids employed, experience to date, and future plans. (Author)

A72-33629 DAMIEN III: A new conception of recording systems for flight tests - An application of the ARINC 573 recording systems for airliners. C. Jouvenot (Société de Fabrication d'Instruments de Mesure, Massy, Essonne, France). In: International Aerospace Instrumentation Symposium, 7th, Cranfield, Beds., England, March 20-23, 1972, Proceedings. Stevenage, Herts., England, Peter Peregrinus, Ltd., 1972, p. 4.1-4.8.

The applicability of the DAMIEN III digital magnetic tape recording system, an outgrowth of the ARINC 573 recording system, in airliner flight test data acquisition is discussed. The DAMIEN III includes a data acquisition unit with a series of signal conditioners, complementary conditioning plates, a control and sampling programming panel, a synchronization subunit, and an analog or digital magnetic tape recorder. V.Z.

A72-33635 The civil application of infra-red scanning techniques using an airborne external instrumentation pod. G. L. Lamers (Nationaal Luchtvaartlaboratorium, Amsterdam, Netherlands). In: International Aerospace Instrumentation Symposium, 7th, Cranfield, Beds., England, March 20-23, 1972, Proceedings. Stevenage, Herts., England, Peter Peregrinus, Ltd., 1972, p. 16.1-16.10.

At the National Aerospace Laboratory (NLR), instrumentation pods are used for installing test equipment on aircraft. The reasons for using such an installation are discussed. Under contract with a governmental working ground, NLR conducts flight trials with a pod containing an infrared scanner and the associated test equipment. A description of the aircraft installation is given, and some operational experience is discussed. Some results of infrared surveys of water and land surfaces for different purposes are presented. (Author)

A72-33637 Static pressure error - An empirical study. A. W. Brant (Negretti and Zambra /Aviation/, Ltd., Croydon, Surrey, England). In: International Aerospace Instrumentation Symposium, 7th, Cranfield, Beds., England, March 20-23, 1972, Proceedings. Stevenage, Herts., England, Peter Peregrinus, Ltd., 1972, p. 19.1-19.3.

The paper outlines the method adopted to establish a simple relationship between static pressure error and measurable flight parameters. Linear relationships were established in respect of many, including supersonic aircraft, and the accuracy of matching to particular characteristics was frequently within 50 ft, the standard deviations being typically 3% of the uncorrected static pressure error. (Author)

A72-33639 Measurements in nonsteady flight - Instrumentation and analysis. H. L. Jonkers, J. A. Mulder, and K. van Woerkom (Delft, Technische Hogeschool, Delft, Netherlands). In: International Aerospace Instrumentation Symposium, 7th, Cranfield, Beds., England, March 20-23, 1972, Proceedings. Stevenage, Herts., England, Peter Peregrinus, Ltd., 1972, p. 21.1-21.10. 8 refs.

The subject of this paper is a method to derive performance, stability, and control characteristics from measurements in nonsteady flight. This method has been developed at the Delft University of Technology during the past decade. A description of a new flight test instrumentation system for measurements in nonsteady flight is presented. Some aspects of the analysis of the measurements are

A72-33640 The influence of instrumentation system accuracy on the evaluated aerodynamic derivatives of an aircraft from flight data. V. Klein (Cranfield Institute of Technology, Cranfield, Beds., England). In: International Aerospace Instrumentation Symposium, 7th, Cranfield, Beds., England, March 20-23, 1972, Proceedings. Stevenage, Herts., England, Peter Peregrinus, Ltd., 1972, p. 22.1-22.11. 7 refs.

The paper considers the relation between the accuracy of an instrumentation system and the accuracy of the evaluated aerodynamic derivatives of an aircraft from flight data using simulated and measured time histories. On the basis of the results obtained and other available information, the basic performance characteristics of a system for the accurate measurement of input and transient response data are proposed. (Author)

A72-33641 Correlation techniques applied to the dynamic testing of aircraft autoland systems. J. D. Lamb, A. R. Pankhurst, and D. R. Towill (University of Wales Institute of Science and Technology, Cardiff, Wales). In: International Aerospace Instrumentation Symposium, 7th, Cranfield, Beds., England, March 20-23, 1972, Proceedings. Stevenage, Herts., England, Peter Peregrinus, Ltd., 1972, p. 23.1-23.7. 13 refs. Research sponsored by the Science Research Council and Ministry of Defence.

The paper describes experiments carried out on a jet aircraft possessing an autoland facility. These experiments are carried out on the ground with the autoland loop closed through simulated engine and aerodynamic characteristics. Cross-correlation functions associated with small height perturbations are obtained by injecting pseudo-random sequences into the system. Significant changes in the cross-correlation function are observed as the system dynamics change, thus offering the possibility of using this approach as a rapid checkout procedure. (Author)

A72-33642 New digital recording methods for flight data acquisition. J. M. King (Royal Aircraft Establishment, Farnborough, Hants., England). In: International Aerospace Instrumentation Symposium, 7th, Cranfield, Beds., England, March 20-23, 1972, Proceedings. Stevenage, Herts., England, Peter Peregrinus, Ltd., 1972, p. 24.1-24.15. 54 refs.

Discussion of the qualities of various techniques as alternatives to magnetic tape recording in airborne data acquisition systems. Special attention is given to such applications of laser beam holographic recorders. The magnetic bubble store and the laser beam holographic recorder are found to show the greatest promise for airborne digital data acquisition systems. V.Z.

A72-33644 The philosophy and implementation of a serial PCM system. J. M. Aucken and H. N. Welby (Hawker Siddeley Aviation, Ltd., Kingston-upon-Thames, Surrey, England). In: International Aerospace Instrumentation Symposium, 7th, Cranfield, Beds., England, March 20-23, 1972, Proceedings. Stevenage, Herts., England, Peter Peregrinus, Ltd., 1972, p. 26.1-26.10.

Discussion of the quality of a new flight test data acquisition and reduction system using a serial pulse code modulation, as a possibly more advantageous one than the established Harrier system. Points requiring proof to demonstrate the viability of the new system are specified. The performance characteristics and the applicability ranges of the Harrier system and the new system are compared. V.Z.

A72-33645 The modular design of digital data acquisition systems for flight test purposes. M. Catton (Plessey Co., Ltd., Havant, Hants., England). In: International Aerospace Instrumentation Symposium, 7th, Cranfield, Beds., England, March 20-23, 1972, Proceedings. Stevenage, Herts., England, Peter Peregrinus, Ltd., 1972, p. 27.1-27.14.

Description of an airborne data acquisition system providing digital readings (to a recorder or telemetry link) from analog signals supplied by a large number of various monitoring transducers. The wide range of requirements dictated by the parameter sensors is satisfied by using a set of circuit modules permitting systems of varying functions and complexity to be assembled from standard units. System considerations that have determined the range of

modules chosen for initial development are described together with the operation and performance of specific modules that have a major influence on the characteristics of the complete system. T.M.

A72-33650 **Hydrofluidic circuit helps handle helicopter.** R. A. Evans (Honeywell, Inc., Government and Aeronautical Products Div., Minneapolis, Minn.) and G. W. Fosdick (U.S. Army, Aviation Material Laboratories, Fort Eustis, Va.). *Hydraulics and Pneumatics*, vol. 25, June 1972, p. 91-93.

A hydrofluidic three-axis stability augmentation system is described which was developed to improve vehicle damping and handling qualities of the UH-1B, without stabilizer bar, during high-speed gunfiring missions. The three-axis stabilization system has three individual pitch-, roll-, and yaw-axis controllers, and three series servoactuators. Detailed design specifications for the stabilization system were written from the six-degree-of-freedom linear perturbation equations of motion which represent mathematically the UH-1B helicopter and from computer simulation diagrams of the stabilization system. V.P.

A72-33679 **Natural vibrations of thin-walled rods and longitudinally stiffened plates and cylindrical shells with allowance for local deformations of the cross section (Eigenschwingungen von dünnwandigen Stäben, Längsversteiften Platten und Zylinderschalen unter besonderer Berücksichtigung örtlicher Verformungen des Querschnitts).** J. Sternberg (Berlin, Technische Universität, Berlin, West Germany). In: Technische Universität Berlin, Institut für Luftfahrzeugbau, Yearbook 1970. Düsseldorf, VDI-Verlag GmbH, 1972, p. 237/1-359. 55 refs. In German. Research supported by the Deutsche Forschungsgemeinschaft.

The eigenvalues of aircraft and rocket structural elements are calculated with the aid of transfer matrices. The structural elements are treated as strips of constant thickness. The vectors are then related by the matrix product of the individual field matrices. Local vibrations are calculated on the assumption of rectilinear nodal lines between the strips (or that the nodal lines arch only in the circumferential direction, in the case of a cylindrical shell). V.P.

A72-33695 # **Nonlinear vortex interactions on wing-canard configurations.** D. Finkleman (USAF, Frank J. Seiler Research Laboratory, Colorado Springs, Colo.). *Journal of Aircraft*, vol. 9, June 1972, p. 399-406. 28 refs.

Sacks' method of simulating vortex sheets with distributions of discrete vortices has been applied to the study of the interaction of a slender wing with a nearby canard surface. The canard is detrimental to both lift and static longitudinal stability. The extent of canard vortex sheet rollup is very important in the interaction. Downward canard deflection may lead to increased lift. For small vertical separations between the surfaces, the forward portion of a pointed wing preceded by a canard is ineffective in producing lift. Vortices of negative sense may be shed when a canard is very close to the wing, and the forward portion of a slender wing in close proximity to a canard surface is ineffective in producing lift. G.R.

A72-33698 # **Scale-model studies of blast-deflection fences for high thrust engines.** J. J. Bertin and J. C. Westkaemper (Texas, University, Austin, Tex.). *Journal of Aircraft*, vol. 9, June 1972, p. 445, 446. Research supported by the Dallas/Fort Worth Regional Airport Authority.

An 0.02 scale model was constructed to represent a twin-engine aircraft, the proposed fence geometries, and the adjacent service roads requiring traffic protection. Data were obtained to define the flowfield immediately upstream of the fence and downstream to the roads. In addition to a single, long primary fence, flowfield data were obtained for double fences in which a smaller, auxiliary fence was

located upstream of the primary fence to provide a sheltered area for ground service equipment. The results of the experimental investigation are discussed. G.R.

A72-33791 **A matrix displacement method for temperature-dependent elastoplastic wing assemblies and continua (Matrizenverschiebungsmethode für temperaturabhängig elastisch-plastische Tragwerke und Kontinua).** D. Radaj (Stuttgart, Universität, Stuttgart, West Germany). *Acta Mechanica*, vol. 14, no. 1, 1972, p. 71-78. 18 refs. In German.

Review of current analysis techniques for nonlinear elastoplastic wing assemblies made of materials whose properties are not affected by temperature variations. A modified version of the matrix displacement method is developed to treat the cases where the elastoplastic properties of the material are temperature-dependent. Exact analysis can be conducted at varying temperature by using the modified method. V.Z.

A72-33797 # **The upper atmospheric environment of the supersonic transport: A bibliography.** A. McLellan (Wisconsin, University, Madison, Wis.). Madison, Wis., University of Wisconsin, 1972. 205 p. \$5.00.

General references pertaining to the structure, composition, and the physical dynamics of the stratosphere are listed together with studies regarding the constituents that make up the composition of the ambient gases available to undergo chemical reactions with the pollutants, the temperature of the stratosphere, and heat flux variations. Other subjects considered include the winds and the transport properties of the stratosphere, the properties of the mesosphere, circulation, synoptic dynamics, and energetics of the stratosphere. G.R.

A72-33874 # **Flight dynamics (Dinamika poleta).** A. M. Mkhitarian, P. A. Mezhlumian, V. S. Maksimov, P. S. Lazniuk, V. Ia. Fridland, L. G. Totishvili, and E. I. Sorokin. Moscow, Izdatel'stvo Mashinostroenie, 1971. 369 p. 28 refs. In Russian.

The textbook (representing a university course on flight dynamics) examines the characteristics of horizontal flight, and of the takeoff, climb, and landing phases. The stability and controllability of an aircraft and its behavior at supercritical angles of attack under unfavorable meteorological conditions are discussed. A chapter is devoted to helicopter flight dynamics. The equations of motion of an aircraft are written in a velocity and coupled system of coordinates, the first being used for solving trajectory problems, and the second in stability and controllability analysis. The stability analysis is based on linear equations of perturbed motion. By using a unified system of coordinates, it proves possible to treat stability and controllability on the basis of the general theory of the stability of motion of a mechanical system. V.P.

A72-33946 # **Hail in the vicinity of organized updrafts.** A. H. Auer, Jr. and J. D. Marwitz (Wyoming, University, Laramie, Wyo.). *Journal of Applied Meteorology*, vol. 11, June 1972, p. 748-752. 13 refs. Research supported by the Research Council of Alberta; NSF Grants No. GA-1527; No. GA-19105.

Several encounters with hail and graupel (often inadvertent) have occurred while flying an aircraft through the organized updrafts at the base of thunderstorms in the High Plains area. These encounters normally occurred while entering or exiting the organized updrafts and while flying in the vicinity of the strong horizontal reflectivity gradients which commonly border organized updrafts. On several occasions mobile ground crews were beneath the organized updrafts and confirmed the observations from the aircraft. These crews also noted the sequence of precipitation events in this region. The hail which falls in this particular region has the following

characteristics: it has a narrow size range, it is large hail (often the largest which falls from the storm), it is commonly not accompanied by rain, and it has a small range of concentrations for a given diameter. The precipitation sequence at the ground over which an organized updraft passes is large hail followed by smaller hail and rain. (Author)

A72-33960 # Errors of an inertial navigation system using a gyrohorizoncompass (K voprosu o pogreshnostiakh inertsial'noi navigatsionnoi sistemy, postroennoi na osnove girogorizontkompasa). V. A. Karakashev and S. Ia. Rozhetskii (Leningradskii Institut Tochnoi Mekhaniki i Optiki, Leningrad, USSR). *Priborostronienie*, vol. 15, no. 4, 1972, p. 76-81. In Russian.

Analysis of the course errors, coordinate errors and speed errors of an inertial navigation system using a gyrocompass and a gyrohorizoncompass. Expressions are derived to determine the dependence of these errors on the instrumental errors of the gyrosystems. Details are given on specific types of errors. V.Z.

A72-34060 * # Analytic prediction of dynamic stall characteristics. L. E. Ericsson and J. P. Reding (Lockheed Missiles and Space Co., Inc., Sunnyvale, Calif.). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-682*. 18 p. 48 refs. Members, \$1.50; nonmembers, \$2.00. Contract No. NAS1-9987.

A new approach is presented for solving the problem of predicting dynamic stall characteristics. In this approach, the unsteady aerodynamic characteristics are related theoretically to static aerodynamic characteristics which are readily available for a great number of airfoil shapes. Using these static experimental data as an input, the developed analytical method predicts dynamic stall characteristics that are in good agreement with available experimental data. The analysis is also extended to include frequency and amplitude modulation effects. O.H.

A72-34061 # A time-dependent solution of mixed flow through convergent nozzles. E. F. Brown and H. M. Ozcan (Virginia Polytechnic Institute and State University, Blacksburg, Va.). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-680*. 9 p. 10 refs. Members, \$1.50; nonmembers, \$2.00. NSF Grant No. GK-5223.

An analytical solution is presented which enables the performance of convergent nozzles operating at supercritical pressure ratios to be predicted. The results of a typical calculation are compared with experimental data and with the predictions of existing analyses. The method employs the nonconservative form of the governing equations and a new treatment of the jet-boundary points which makes use of the time-dependent method of characteristics. Calculations reveal good convergence properties, are in good agreement with experimental data, and possess an accuracy superior to that which can be obtained with existing methods. The computational speed of this method is four times that of only other time-dependent solution of this problem. (Author)

A72-34063 * # Numerical calculation of transonic flow about swept wings. W. F. Ballhaus and F. R. Bailey (NASA, Ames Research Center, Moffett Field, Calif.). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-677*. 11 p. 13 refs. Members, \$1.50; nonmembers, \$2.00.

Description of a mixed elliptic-hyperbolic relaxation algorithm which calculates solutions to the three-dimensional, nonlinear transonic small disturbance potential equation for flows about thin swept lifting wings with free-stream Mach number less than 1. The

algorithm is designed to treat supercritical flows, including cases with embedded shock waves. Nonrectangular planform shapes, including sweep and taper, are treated by a coordinate transformation which maps the wing planform into a rectangle. Computed results at angles of attack of 0 and 2 deg for a AR = 4, constant chord, 23.75 deg sweptback planform model with a Lockheed C141 airfoil section are compared with data obtained experimentally for both subcritical and supercritical flows. Subcritical results are also compared with those obtained by a subsonic 'panel' method. (Author)

A72-34070 * # Prediction of internal and external noise fields for blowdown wind tunnels. R. N. Hosier and W. H. Mayes (NASA, Langley Research Center, Hampton, Va.). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-668*. 6 p. 11 refs. Members, \$1.50; nonmembers, \$2.00.

Empirical methods have been developed to estimate the test section noise levels and the outside noise radiation patterns of blowdown wind tunnels. Included are considerations of noise generation by control valves, burners, turbulent boundary layers, and exhaust jets as appropriate. Sample test section and radiation field noise estimates are presented. The external estimates are noted to be in good agreement with the limited amount of available measurements. (Author)

A72-34072 * # Maximum noise abatement trajectories. S. Zeldin and J. Speyer (MIT, Cambridge, Mass.). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-665*. 16 p. 10 refs. Members, \$1.50; nonmembers, \$2.00. Contract No. NAS2-6437. DSR Project 55-45900.

Minimum noise annoyance trajectories for developing STOL operation procedures are obtained by modulating five control variables in two dimensions. The performance index is formulated such that it explicitly assigns the same relative importance to thrust as it does to distances between discrete listeners and the aircraft. However, using a steepest descent optimization program, results indicate that it is preferable to keep the thrusters at their maximum value to minimize the integrated annoyance rather than to reduce thrust which would lower the instantaneous annoyance. Thrust decreases below its bound only when the instantaneous noise at a listener is limited. (Author)

A72-34076 # Assessment of climatic changes due to flights in the stratosphere. A. J. Grobecker (U.S. Department of Transportation, Washington, D.C.). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-658*. 17 p. Members, \$1.50; nonmembers, \$2.00.

The Department of Transportation's Climatic Impact Assessment Program is described. The objective of this program is to assess, in the form of a report in 1974, the impact of climatic changes resulting from perturbation of the upper atmosphere by the propulsion effluents of a world high-altitude aircraft fleet as projected to 1990. The nature of the stratosphere is to be considered together with the propulsion effluents, the perturbations in the stratosphere and troposphere, the biological environmental effect of the tropospheric changes, and the economic aspects involved. G.R.

A72-34077 * # The NASA/GE quiet engine 'A.' M. J. Benzakein, S. B. Kazin (General Electric Co., Cincinnati, Ohio), and F. Montegani (NASA, Lewis Research Center, Cleveland, Ohio). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-657*. 9 p. 5 refs. Members, \$1.50; nonmembers, \$2.00. Contract no. NAS3-12430.

The National Aeronautics and Space Administration and the General Electric Company are jointly developing two low noise propulsion technology demonstrators (Engine 'A' and 'C' incorporating respectively a low tip speed and high tip speed fan) under the Experimental Quiet Engine Program. The acoustic and aerodynamic performance characteristics of Engine 'C' which is currently on test will be reported at a later date. The present paper describes the design, component development and engine evaluation of the 'A' demonstrator. The aerodynamic and acoustic performance obtained on the fan component are discussed. The demonstrator engine acoustic test program is outlined. The effect of inlet geometry and duct acoustic treatment are presented. The static acoustic data are extrapolated to flight and compared with the FAA noise regulations. (Author)

A72-34078 # Vortex noise of isolated airfoils. R. W. Paterson, P. G. Vogt, M. R. Fink, and C. L. Munch (United Aircraft Research Laboratories, East Hartford, Conn.). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-656.* 10 p. 8 refs. Members, \$1.50; nonmembers, \$2.00. Grant No. DAHC04-69-C-0089.

Description of an experimental study of airfoil vortex shedding noise in a low-turbulence flow and in a Reynolds number range applicable to full-scale helicopter rotors. Measurements of far-field noise, airfoil surface pressure fluctuations, and correlation coefficients were obtained for NACA 0012 and NACA 0018 two-dimensional models and a finite-span NACA 0012 airfoil. Airfoil vortex shedding noise was found to be discrete rather than broadband, with the frequency predicted by a Strouhal number of approximately 0.2 referenced to twice the trailing-edge laminar boundary layer thickness. At Reynolds numbers and angles of attack for which this boundary layer was turbulent on both surfaces, vortex noise was undetectable above turbulent boundary layer noise. The effects of airfoil thickness change and finite airfoil span were found to be small, consistent with their influence on the pressure-surface laminar boundary layer. (Author)

A72-34079 # Effect of leading edge serrations on noise radiation from a model rotor. R. E. A. Arndt (Pennsylvania State University, University Park, Pa.) and R. T. Nagel. *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-655.* 10 p. 11 refs. Members, \$1.50; nonmembers, \$2.00. Navy-supported research.

The possibility of using leading edge serrations for rotor noise reduction is examined experimentally. Consideration is given to both the acoustic and aerodynamic characteristics of rotors with and without leading edge devices. Measurement of total radiated power, directivity and near field sound pressure level all indicate that reduction in noise is possible with specific leading edge configurations and running conditions. Both vortex noise and rotational noise is attenuated. Hot wire and flow visualization studies indicate that the reduction in vortex noise is associated with changes in the vortex shedding characteristics. Reductions in rotational noise are correlated with thrust and torque data. (Author)

A72-34080 * # Ballistic range investigation of sonic-boom overpressures in water. G. N. Malcolm and P. F. Intrieri (NASA, Ames Research Center, Moffett Field, Calif.). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-654.* 12 p. 7 refs. Members, \$1.50; nonmembers, \$2.00.

An investigation of sonic-boom overpressures in water has been conducted by gun-launching small cone-cylinder models over water. Flights were conducted at Mach numbers of 2.7 and 5.7, in air,

corresponding to Mach numbers of 0.6 and 1.3, respectively, in water. Shadowgraph pictures and underwater pressure measurements indicate that for horizontal flights at Mach numbers below Mach 4.4 in air (i.e., subsonic relative to the speed of sound in water) the resulting underwater disturbance is an acoustic wave whose peak pressure attenuates rapidly with water depth. In contrast, at supersonic Mach numbers, relative to water, the incident shock wave at the surface is transmitted into the water as a propagating shock wave and the peak pressure associated with it does not attenuate with water depth. (Author)

A72-34081 # An analytical study of some possible sonic boom alleviation schemes. F. W. Lipfert (General Applied Science Laboratories, Inc., Westbury, N.Y.). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-653.* 13 p. 25 refs. Members, \$1.50; nonmembers, \$2.00. U.S. Department of Transportation Contract No. FA70WA-2320.

The potential of modifying supersonic aircraft sonic boom signatures by means of altering the flow field in the vicinity of the aircraft has been investigated theoretically using a specific airplane and real atmospheric properties. Finite rise times, reduced overpressures, and reduced shock pressure rises were among the signature improvements investigated. Flow field alteration mechanisms considered included free combustion, boundary layer mass addition, force fields, and laser-generated heat fields. Weight penalties of the order of the baseline aircraft gross weight were found for all attempts to modify the complete baseline aircraft signature. If this additional weight were borne by the baseline aircraft, an additional overpressure would result which would, in many cases, negate the effect of the signature improvement. (Author)

A72-34082 # Studies on sonic boom at high Mach numbers. Y. S. Pan and M. O. Varner (Tennessee, University, Tullahoma, Tenn.). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-652.* 12 p. 24 refs. Members, \$1.50; nonmembers, \$2.00.

Theoretical studies on sonic boom at high Mach numbers are presented. For a sharp-nosed slender axisymmetric body, the flow field is studied based on a shock-expansion method. To the first approximation, a quasi-linear approach to the rotational flow field behind the attached finite leading shock wave is presented. It is found that the cumulative effects of the rotational flow field modify the shock position and the pressure signature in the far field. For a blunt-nosed body at hypersonic speeds, the far-field flow patterns are obtained by using the hypersonic equivalence principle and the existing near-field cylindrical wave solution. Both methods of calculation are outlined. Examples are presented and limitations of the present studies are discussed. (Author)

A72-34084 * # Dispersion of SST trails in the stratosphere. T. J. Overcamp and J. A. Fay (MIT, Cambridge, Mass.). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-650.* 7 p. 12 refs. Members, \$1.50; nonmembers, \$2.00. Grant No. NGL-22-009-378.

A simple theory for the dispersion of the exhaust of a supersonic transport cruising in the stratosphere is presented. This model shows that far downstream from the aircraft, buoyancy dominates the growth of the wake. This growth is limited by the stable stratification of the atmosphere. Data on the visible width of the wake from scaled experiments in a towing tank and from studies on the growth of contrails of subsonic aircraft verify the growth of the wake in an unstratified atmosphere is predicted by the model. This growth is faster than would be predicted for the wake of an axisymmetric body with no buoyancy. (Author)

A72-34087 * # Effects of rotating flows on combustion and jet noise. I. R. Schwartz (NASA, Ames Research Center, Moffett Field, Calif.). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-645.* 10 p. 23 refs. Members, \$1.50; nonmembers, \$2.00.

Experimental investigations of combustion in rotating (swirling) flow have shown that the mixing and combustion processes were accelerated, flame length and noise levels significantly decreased, and flame stability increased relative to that obtained without rotation. Unsteady burning accompanied by a pulsating flame, violent fluctuating jet, and intense noise present in straight flow burning were not present in rotating flow burning. Correlations between theory and experiment show good agreement. Such effects due to rotating flows could lead to suppressing jet noise, improving combustion, reducing pollution, and decreasing aircraft engine size. Quantitative analysis of the aero-acoustic relationship and noise source characteristics are needed. (Author)

A72-34088 # Turbulence and acoustic characteristics of screen perturbed jets. R. E. A. Arndt (Pennsylvania State University, University Park, Pa.), N. Tran, and G. Barefoot. *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-644.* 11 p. 20 refs. Members, \$1.50; nonmembers, \$2.00. Navy-supported research.

The placement of a screen across a jet flow results in a substantial reduction in noise. This paper describes an experimental investigation of the phenomenon, consisting of two parts: acoustic measurements with a 2-inch air jet in an anechoic chamber and velocity and pressure measurements in the mixing zone of a 12-inch jet. The perturbed jet has a relatively flat radiated noise spectrum and an omi-directional intensity pattern. This is apparently due to an extensive reduction in quadrupole radiation with an increase in dipole radiation, the net result at high Mach number being favorable. The reduction in quadrupole noise is traced to a breaking up of the large structure in the mixing zone. (Author)

A72-34089 * # Correlation of total sound power and peak sideline OASPL from jet exhausts. U. H. von Glahn (NASA, Lewis Research Center, Jet Acoustics Branch, Cleveland, Ohio). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-643.* 7 p. 8 refs. Members, \$1.50; nonmembers, \$2.00.

An empirical analysis of jet noise is made for convergent exhaust nozzles. This study, conducted at the Lewis Research Center, presents an engineering approach to the correlation of total sound power and maximum sideline OASPL (at 200 ft) for both subsonic and supersonic jets based on available data. Data correlation for subsonic jets shows no dependency of total sound power and maximum sideline OASPL on jet density. The analysis for supersonic jets results in a correlation parameter for jet total sound power consisting of the conventional Lighthill parameter modified by considerations of jet Mach number and jet acoustic velocity. Similar parameters also correlate the maximum sideline OASPL for supersonic jets. (Author)

A72-34090 # Flow, thrust, and acoustic characteristics of 50 tubes with 50 shrouds supersonic jet noise suppressor. H. T. Nagamatsu and R. E. Sheer, Jr. (GE Research and Development Center, Schenectady, N.Y.). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-642.* 16 p. 16 refs. Members, \$1.50; nonmembers, \$2.00. FAA-supported research.

A supersonic jet noise suppressor consisting of 50 tubes of various lengths and with a single and 50 hexagonal shrouds was investigated at a jet Mach number of 1.4. Optical photographs, radial

and axial flow surveys, piezoelectric pressure fluctuations, and acoustic data were obtained for the plain jet and multitubes with shrouds. The sonic location on the axis was decreased from 18.7 in. to 2 in. with 50 tubes. With the 6 in. long multishroud the Mach number at the shroud exits was approximately 0.85 with an overall sound power level reduction of approximately 20 dB. With 50 tubes the thrust loss was 3.34 percent with overall sound power reduction of 11.2 dB. With the addition of multishrouds, the thrust loss was 26.7 percent with a power reduction of 20.3 dB. (Author)

A72-34091 * # A systematic study of supersonic jet noise. J. F. Louis, R. P. Letty, and J. R. Patel (MIT, Cambridge, Mass.). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 5th, Boston, Mass., June 26-28, 1972, Paper 72-641.* 13 p. 17 refs. Members, \$1.50; nonmembers, \$2.00. U.S. Department of Transportation Contract No. TSC-142; Grant No. NGL-22-009-383.

The acoustic fields for a rectangular and for an axisymmetric nozzle configuration are studied. Both nozzles are designed for identical flow parameters. It is tried to identify the dominant noise mechanisms. The other objective of the study is to establish scaling laws of supersonic jet noise. A shock tunnel is used in the investigations. Measured sound directivity, propagation direction of Mach waves obtained by shadowgraphs, and the slight dependence of the acoustic efficiency on the level of expansion indicate that Mach waves contribute significantly to the noise produced by a rectangular jet. G.R.

A72-34108 # UAC Karlsruhe - The operational concept for the civil/military integrated upper area control centre at Karlsruhe. C. Dieben. *Eurocontrol*, vol. 2, no. 5, 1972, p. 8-13.

The area control center at Karlsruhe, Federal Republic of Germany, is to provide air traffic control services for the upper airspace of Southern Germany. The air traffic characteristics of the area to be served are discussed together with the operational concept, aspects of civil and military integration, problems of sectorization, data sources, features of automation, and details regarding the building provided for the control center. The control center will receive primary and secondary radar data from four radar sites, which will provide information concerning the position, the identity, and the flight level of an aircraft. G.R.

A72-34109 # Mediator - The development of a joint civil/military ATC organisation at the London air traffic control centre, West Drayton. *Eurocontrol*, vol. 2, no. 5, 1972, p. 19-27.

The Mediator plan for civil and military ATC evolved from a decision made in 1962 to integrate two separate Defence and ATC development plans then in existence. The objectives of the Mediator plan are discussed together with details regarding the traffic to be controlled in the Mediator airspace, aspects of ATC organization, and information regarding the implementation of the Mediator plan. Questions of sectorization are considered together with operations room layout, control suite facilities, radar data sources, radar displays, flight plan processing, and communications. G.R.

A72-34136 Integrated inertial/VOR/DME-navigation with the aid of adjustment according to the method of least squares (Integrierte Inertial/VOR/DME-Navigation durch Ausgleichung nach der Methode der kleinsten Quadrate). K. Ramsayer (Stuttgart, Universität, Stuttgart, West Germany). *Ortung und Navigation*, no. 1, 1972, p. 69-91. 8 refs. In German.

Description of a method for updating an inertial navigation system (INS) by VOR/DME or TACAN. The geographical coordinates indicated by INS are transformed in short time intervals to slant range and bearing referring to that VOR/DME or TACAN

station for which range and bearing information is available. The computed values are compared with the corresponding measured values. The differences are explained by errors of latitude, longitude, speed, and course determined by INS, and by random errors of the measured quantities. As the errors of INS, which are taken into account, are changing slowly, it is possible to introduce mean values for these errors over intervals shorter than 10 min. These mean values are determined by a least square adjustment in such a way, that the square sum of the corrections of the measured ranges and bearings with consideration of the different weights is a minimum. (Author)

A72-34137 Collision avoidance devices (Geräte zur Kollisionsabwendung). J. L. Parsons. *Ortung und Navigation*, no. 1, 1972, p. 93-104. In German.

Description of a recently developed series of collision avoidance devices, and review of the results of flight tests of these devices. The instruments comprising the so-called SECANT system are discussed, including a collision course indicator, an adjacent flight indicator, a collision avoidance indicator, an automatic pilot, and a responder. The SECANT system is distinguished by the fact that it requires no expensive clocks on board the aircraft and requires no cadencing by radio from a ground station.

A72-34138 Technical aspects and problems in connection with the use of the L band in a satellite system for air navigation support (Technische Aspekte und Probleme im Zusammenhang mit der Benutzung des L-Bandes in einem Satellitensystem zur Unterstützung der Luftnavigation). G. Quaglione and E. Vitali. *Ortung und Navigation*, no. 1, 1972, p. 105-131. 8 refs. In German.

Description of the essential technical and operational features of a hypothetical satellite-supported air navigation system employing the L band (from 1540 to 1660 MHz) for data transmission. Some comments are made concerning the portion of the overall system responsible for speech comprehension, the direction-finding accuracy in the L band is discussed, and the data channels and modulation procedures are described. A study is made of various phenomena which can affect systems operating in the L band, and calculations of the receiver noise temperature in the L band are presented. Some technical and economic considerations concerning data transmission from satellite to aircraft, from earth to satellite, and from aircraft to satellite are evaluated.

A72-34143 Segregating the aircraft. B. Mayes. *Flight International*, vol. 101, June 15, 1972, p. 870a-873.

It is pointed out that various pressures have been working against the simple process of transferring passengers between aircraft and terminal buildings. The solution to these pressures has been to bring aircraft into direct connection with the buildings serving them by making use of flexible mobile bridges. However, several problems connected with this approach have led to design solutions, working basically on a 'separation' theory. The new approach involves total separation between aircraft and permanent buildings, allowing each to function independently with little cross-interference. Dulles Airport uses mobile lounges to transport passengers from terminal to aircraft. In another airport passengers will be shuttled from the central terminal building to hold-room clusters on an underground system of three dual-track automated 'jetcars.'

G.R.

A72-34144 Producing the right response. H. Cowin. *Flight International*, vol. 101, June 15, 1972, p. 877a, 878.

Jaguar flight controls comprise wing spoilers, slab tailplane, and rudder. All controls are fully powered, with no manual reversion. An auto-stabilization system, acting on tailplane, rudder, and spoilers is also included. A further stipulation regarding the auto-stabilization requires that no pilot retrimming action should be needed after switching the system on or off, regardless of flight conditions. In order to meet the unusually stringent specifications flight-control components were grouped into small, integrated actuator packages.

THE ROLE OF FLUCTUATING FORCES IN THE GENERATION OF COMPRESSOR NOISE

Hanno H. Heller and Sheila E. Widnall Washington NASA May 1972 112 p refs

(Contract NAS1-9883)

(NASA-CR-2012; Rept-2160) Avail: NTIS HC \$3.00 CSCL 01A

The results of a theoretical and experimental study on the role of aerodynamically-induced fluctuating forces in the sound generation by axial-flow compressors are presented. Analytical models for the generation and radiation of sound by rotor/stator combinations were developed. For the experimental substantiation of the analytical results, the technology was developed to measure fluctuating forces directly on rotating airfoils using miniature differential-pressure sensors and FM telemetry. Under the assumption of full coherence of the force field on the blade, radiated sound power was predicted from the force measurements on blades and compared with measured sound power. Both broadband radiation from a single rotating airfoil and discrete frequency radiation due to interaction of multi-bladed stator/rotor configurations were investigated. The results indicate the necessity to obtain information on the details of the force field for accurate prediction of the radiated sound spectrum. Author

EFFECTS OF BODY SHAPE ON THE AERODYNAMIC CHARACTERISTICS OF AN ALL-BODY HYPERSONIC AIRCRAFT CONFIGURATION AT MACH NUMBERS FROM 0.65 TO 10.6

Walter P. Nelms, Jr. Washington May 1972 61 p refs

(NASA-TN-D-6821; A-4297) Avail: NTIS HC \$3.00 CSCL 01A

An experimental investigation was conducted to determine the effects of several variations in body shape on the aerodynamic characteristics of an all-body hypersonic aircraft configuration. The basic configuration had a delta planform with an elliptic cone forebody and an afterbody of elliptic cross section terminating in a straight-line trailing edge. Variations in body shape included the ratio of maximum cross-sectional to body planform area, body leading-edge sweep, and forebody length ratio. In addition, the effects of a thin wing mounted on one of the bodies was

investigated, and the aerodynamic characteristics of just the forebodies of two of the configurations were determined. The models had no stabilizing surfaces or propulsion system packages. Ranges of angle of attack (-4 deg to +15 deg) and angle of sideslip (-4 deg to +8 deg) were investigated. Of the four complete bodies, the configuration with the lowest ratio of cross-sectional to body planform area had the highest maximum lift-drag ratio and the greatest level of longitudinal stability at most Mach numbers. All the configurations had positive longitudinal stability near maximum lift-drag ratio at most Mach numbers. With exception of the lowest subsonic Mach numbers, changes in body sweep angle and in forebody length ratio had only minor effects on maximum lift-drag ratio. Author

WIND TUNNEL TEST OF A POWERED TILT-ROTOR PERFORMANCE MODEL, VOLUME 5 Final Report, Jun. Dec. 1970

John P. Magee, Robert B. Taylor, Frank J. McHugh, Nelson Miller, and Leon N. DeLarm Oct. 1971 510 p

(Contract F33615-69-C-1577)

(AD-736824; D213-10000-5; AFFDL-TR-71-62-Vol-5) Avail: NTIS CSCL 01/3

Wind tunnel test data obtained with a full span, two prop. tilt rotor, powered model are reported. Data were taken in hover, transition and cruise flight conditions and include performance, stability and control and blade loads information. The effects of the rotors, tail surfaces and airframe on the performance and stability are isolated as are the effects of the airframe on the rotors. Predicted rotor frequencies were verified, both static and rotating, and since they influence rotor response characteristics, correlation for stability and blade load data is included. Author (GRA)

A GENERAL CLASS OF AIRFOILS CONFORMALLY MAPPED FROM A CIRCLE

Richard M. James 27 May 1971 92 p refs

(Contract F44620-70-C-0108; AF Proj. 9781)

(AD-738318; MDC-J5108; AFOSR-72-0370TR) Avail: NTIS CSCL 20/4

Exact or analytical solutions for flows about airfoils displaying certain prescribed features may require a special program incorporating many different features. To avoid unnecessary labor and simplify a much abused background of traditional 'exact' airfoils, the report presents a general mapping procedure and account of the supporting theory. Special features needed for a computer program and to describe limiting behavior are included for zero trailing-edge angle. In addition, a capability for generating exact solutions in the presence of an isolated external vortex simulating a slat is described and illustrated briefly. GRA

SECOND-ORDER SINGULAR ARCS IN TRAJECTORY OPTIMIZATION Ph.D. Thesis

John Frederick Dixon 1971 101 p
 Avail: Univ. Microfilms Order No. 71-23498

The basic features of singular optimal control are explained briefly and the order of singularity is defined. As an example of the second-order junction phenomenon an analysis of an unsymmetrical version of the Fuller problem is presented. The surprisingly complex solution of this problem calls for the optimal control to alternate between the control bounds with a frequency which becomes infinite at an accumulation point as a second-order singular arc is joined. It is shown that only a very slight penalty in cost results if the infinite sequence of control switches is terminated after the first few switches in favor of a convenient suboptimal policy. It is demonstrated that a second-order singular arc appears in the solution of a minimum time ascent problem for supersonic aircraft, with thrust and drag treated as functions of altitude and speed only. In this formulation the time rate of change of flight path angle is the control. Intermediate thrust arcs occurring in the study of minimum fuel space trajectories are investigated. Dissert. Abstr.

AIRCRAFT TRAJECTORY OPTIMISATION USING PONT-RYAGIN'S MINIMUM PRINCIPLE
 M. W. Winn Mar. 1971 67 p refs
 (Contract KV/B/627/CB.64(A))
 (ETN-4) Copyright. Avail: Issuing Activity

Theoretical derivation of Pontryagin minimum principles is discussed. A method for numerically solving the differential equations was developed, based on the gradient or steepest descent minimization procedure, incorporating a Runge-Kutta-Gill numerical integration routine. The method is applied to solving: (1) the minimum time heading change of an aircraft and (2) the coplanar minimum time intercept of a target aircraft by a chase aircraft. Author (ESRO)

PRELIMINARY NOISE TESTS OF THE ENGINE-OVER-THE-WING CONCEPT. 1: 30 DEG - 60 DEG FLAP POSITION
 Meyer Reshotko, William A. Olsen, and Robert G. Dorsch Mar. 1972 28 p refs
 (NASA-TM-X-68032) Avail: NTIS HC \$3.50 CSCL 01C

The results of preliminary acoustic tests of the engine over the wing concept are summarized. The tests were conducted with a small wing section model (32 cm chord) having two flaps set at the landing position, which is 30 and 60 deg respectively. The engine exhaust was simulated by an air jet from a convergent nozzle having a nominal diameter of 5.1 centimeters. Factors investigated for their effect on noise include nozzle location, wing shielding, flap leakage, nozzle shape, exhaust deflectors, and internally generated exhaust noise. Author

AERODYNAMIC CHARACTERISTICS OF A LARGE SCALE LIFT FAN TRANSPORT MODEL WITH PODDED FANS FORWARD AND LIFT CRUISE FANS MOUNTED ABOVE THE WING
 Jerry V. Kirk, Stanley O. Dickinson, Leo P. Hall, and Mary G.

Coffman Apr. 1972 132 p refs
 (NASA-TM-X-62151) Avail: NTIS HC \$8.75 CSCL 01B

The aerodynamic characteristics of a large scale V/STOL transport model powered by tip-turbine driven lift fans were investigated. The model had four fans; the forward fans were mounted in pods forward of the wing at midsemispan. The aft fans were placed in cruise nacelles behind and above the wing. A cascade of variable camber exit louvers was placed behind each of the lift-cruise fans to turn the fan flow in the lift direction for hover and transition to wing supported flight. The wing of the model was mounted above the fuselage, had an aspect ratio of 5.8, sweepback of 35 deg at the quarter chord line and a taper ratio of 0.3. Various configurations of the model were tested to explore the transition speed range. Fan performance, turning effectiveness of the variable camber exit louvers, longitudinal and lateral-directional characteristics with fan operation in crossflow are presented. Author

LARGE-SCALE WIND-TUNNEL INVESTIGATION OF THE NOISE CHARACTERISTICS OF A SEMISPAN WING EQUIPPED WITH AN EXTERNALLY BLOWN JET FLAP
 Michael D. Falarski May 1972 118 p refs Prepared in cooperation with Army Air Mobility Res. and Develop. Lab. (NASA-TM-X-62154) Avail: NTIS HC \$8.00 CSCL 01B

A wind tunnel investigation was made of the noise characteristics of a 4.42 m (14.5 foot) semispan, externally-blown jet flap model. The model was equipped with a single 76.2 cm (30 inch) diameter, ducted fan with a 1.03 pressure ratio. The effects of flap size, fan vertical location, and forward speed on the noise characteristics were studied. The data from the investigation is presented in the form of tabulated one-third octave band frequency spectrums and perceived noise levels for each test condition. Author

AEROBUS: THE AIRCRAFT OF THE FUTURE (BASIC PROBLEMS OF DESIGNING AIR BUSES)
 V. Sheynin May 1972 9 p Transl. into ENGLISH from Grazhdanskaya Aviatsiya, no. 1, 1972 p 24-27
 (NASA-TT-F-14240) Avail: NTIS HC \$3.00 CSCL 01B

The problems associated with the design of air bus type aircraft are discussed. The primary design problem is identified as the size and weight of the aircraft. Other problems involved in the aircraft configuration are concerned with the cross sectional shape of the fuselage, the location of the engines, accommodations for the passengers, and a compromise on the maximum cruise speed to be permitted during operation. The rationale behind various decisions for the air bus design are explained. Author

PERFORMANCE OF AN AIRCRAFT TIRE UNDER CYCLIC BRAKING AND OF A CURRENTLY OPERATIONAL ANTISKID BRAKING SYSTEM

John A. Tanner Washington May 1972 25 p refs (NASA-TN-D-6755; L-7640) Avail: NTIS HC \$3.00 CSCL 01B

An experimental investigation was conducted to study the performance of an aircraft tire under cyclic braking conditions and to study the performance of a currently operational aircraft antiskid braking system. Dry, damp, and flooded runway surface conditions were used in the investigation. The results indicated that under cyclic braking conditions the braking and cornering-force friction coefficients may be influenced by fluctuations in the vertical load, flexibility in the wheel support, and the spring coupling between the wheel and the tire-pavement interface. The cornering capability was shown to be negligible at wheel slip ratios well below a locked-wheel skid under all test surface conditions. The maximum available brake-force friction coefficient was shown to be dependent upon the runway surface condition, upon velocity, and, for wet runways, upon tire differences. Moderate reductions in vertical load and brake system pressure did not significantly affect the overall wet-runway performance of the tire.

FLIGHT CALIBRATION OF COMPENSATED AND UNCOMPENSATED PITOT-STATIC AIRSPEED PROBES AND APPLICATION OF THE PROBES TO SUPERSONIC CRUISE VEHICLES

Lannie D. Webb and Harold P. Washington Washington May 1972 43 p refs (NASA-TN-D-6827; H-665) Avail: NTIS HC \$3.00 CSCL 01D

Static pressure position error calibrations for a compensated and an uncompensated XB-70 nose boom pitot static probe were obtained in flight. The methods (Pacer, acceleration-deceleration, and total temperature) used to obtain the position errors over a Mach number range from 0.5 to 3.0 and an altitude range from 25,000 feet to 70,000 feet are discussed. The error calibrations are compared with the position error determined from wind tunnel tests, theoretical analysis, and a standard NACA pitot static probe. Factors which influence position errors, such as angle of attack, Reynolds number, probe tip geometry, static orifice location, and probe shape, are discussed. Also included are examples showing how the uncertainties caused by position errors can affect the inlet controls and vertical altitude separation of a supersonic transport.

TABULATED PRESSURE MEASUREMENTS ON A LARGE SUBSONIC TRANSPORT MODEL AIRPLANE WITH HIGH BYPASS RATIO, POWERED, FAN JET ENGINES

Stuart G. Flechner and James C. Patterson, Jr. Washington May 1972 345 p refs (NASA-TM-X-2530; L-8182) Avail: NTIS HC \$3.00 CSCL 01B

An experimental wind-tunnel investigation to determine the aerodynamic interference and the jet-wake interference associated with the wing, pylon, and high-bypass-ratio, powered, fan-jet model engines has been conducted on a typical high-wing logistics transport airplane configuration. Pressures were measured on the wing and pylons and on the surfaces of the engine fan cowl, turbine cowl, and plug. Combinations of wing, pylons, engines, and flow-through nacelles were tested, and the pressure coefficients are presented in tabular form. Tests were conducted at Mach numbers from 0.700 to 0.825 and angles of attack from -2 to 4 deg.

EVALUATION OF EXECUTIVE JET APPROACH ANGLES Final Report

Frank Parr Apr. 1972 73 p (FAA-FS-600-7) Avail: NTIS HC \$5.75

Evaluations were flown in the Aero Jet Commander, Gates Lear Jet, North American Sabreliner, and Lockheed JetStar. Approach slope angles were varied from approximately 3 degrees up to almost 7 degrees. Flight parameters were measured in the areas of descent airspeed, power requirements in flare, flyability, sink rates, threshold crossing heights, and touchdown distances. Objective and subjective measurements were made. It was found that when approach slope angles above 4 degrees (approximate minimums of 400 feet altitude - 1 mile visibility) were used they were accompanied by problems of power requirement, flyability, high sink rates, and long touchdown distances.

AN EVALUATION OF STRING THEORY FOR THE PREDICTION OF DYNAMIC TIRE PROPERTIES USING SCALE MODEL AIRCRAFT TIRES
S. K. Clark, R. N. Dodge, and G. H. Nybakken Washington
NASA Jun. 1972 54 p refs
(Grant NGL-23-005-010)
(NASA-CR-2058; Rept-056080-18-T) Avail: NTIS HC \$3.00 CSCL 01B

The string theory was evaluated for predicting lateral tire dynamic properties as obtained from scaled model tests. The experimental data and string theory predictions are in generally good agreement using lateral stiffness and relaxation length values obtained from the static or slowly rolling tire. The results indicate that lateral forces and self-aligning torques are linearly proportional to tire lateral stiffness and to the amplitude of either steer or lateral displacement. In addition, the results show that the ratio of input excitation frequency to road speed is the proper independent variable by which frequency should be measured. Author

(Contract NAS1-10044)
(NASA-CR-2043; D-210-10392-1) Avail: NTIS HC \$3.00 CSCL 01C

A program was conducted during which test subjects evaluated the simulated sounds of a helicopter, a tilt wing aircraft, and a 15 second, 90 PNdB (indoors) turbojet aircraft used as reference. Over 20,000 evaluations were made while the test subjects were engaged in work and leisure activities. The effects of level, exposure time, distance and aircraft design on subjective acceptability were evaluated. Some of the important conclusions are: (1) To be judged equal in annoyance to the reference jet sound, the helicopter and tilt wing sounds must be 4 to 5 PNdB lower when lasting 15 seconds in duration. (2) To be judged significantly more acceptable than the reference jet sound, the helicopter sound must be 10 PNdB lower when lasting 15 seconds in duration. (3) To be judged significantly more acceptable than the reference jet sound, the tilt wing sound must be 12 PNdB lower when lasting 15 seconds in duration. (4) The relative effect of changing the duration of a sound upon its subjectively rated annoyance diminishes with increasing duration. It varies from 2 PNdB per doubling of duration for intervals of 15 to 30 seconds, to 0.75 PNdB per doubling of duration for intervals of 120 to 240 seconds. Author

ON THE INFLUENCE OF LIFT ENGINE ARRANGEMENT ON THE EIGENMOTION OF LIFT JET POWERED VTOL AIRCRAFT IN HOVERING FLIGHT [UEBER DEN EINFLUSS DER HUBTRIEBWERKSANORDNUNG AUF DIE EIGENBEWEGUNG STRAHLGESTUETZTER VTOL-FLUGZEUGE IM SCHWEBEFLUG]

Dietrich Hanke 1971 51 p refs In GERMAN; ENGLISH summary
(DLR-FB-71-112) Avail: NTIS HC \$4.75; DFVLR, Porz 12.50 DM

The influence of lift engine arrangement on the stability of lift jet powered VTOL-aircraft in hovering flight is investigated. To that end, the forces and moments occurring at the inlet in consequence of the air masses sucked in by the engines are computed by means of the momentum theory. Furthermore, the engine derivatives are derived and equations of motion for hovering flight are defined. For eight VTOL configurations with different lift engine arrangement, the eigenvalues of the coupled longitudinal and lateral motion are computed. The vertical distance of engine inlets from the center of gravity of the aircraft proves to be the essential stability parameter. Author (ESRO)

 (AD-738203; D210-10079-1; USAAMRDL-TR-71-42) Avail: NTIS CSCL 01/3

The report presents the results of a program to design, tool, fabricate, bench test, and flight test glass-reinforced epoxy rotor blades. Blade design used S-glass reinforced epoxy, a mechanically trapped and bonded titanium root end attachment, and aerodynamic contours employing advanced airfoils, thickness taper, and planform taper. Fiberglass tooling was successfully employed, and fabrication and quality assurance techniques were developed for the prototype quantity of 12 rotor blades. Static and fatigue tests were conducted for both rotor blade elements and full-scale structure, and whirl test demonstration was completed. Exploratory flight testing was performed on a CH-47C prototype instrumented aircraft used as a test-bed.

 (Contract N00014-71-C-0062; NR Proj. 212-202)
 (AD-737694; NR71H-317) Avail: NTIS CSCL 01/3

A study was conducted to determine the effect of the control device characteristics on airplane agility at transonic speeds. A list of over 600 reports containing data on various control devices is presented. A discussion of the more widely used control devices is presented together with data showing trends and general characteristics. From this list of control devices certain devices were selected for evaluation on a baseline configuration. An Agility Index was formulated for the evaluation of the selected control devices. The results of this portion of the study showed certain control devices than enhanced agility. A fighter aircraft was configured with the agility enhancement control devices, evaluated for agility and compared to the baseline airplane. Author (GRA)

SOME CHARACTERISTICS OF THE HYDRODYNAMICS OF AN ENGINE OF THE FLAPPING WING TYPE

Yu. K. Savchenko *In its Bionics* 15 May 1972 p 10-22 refs

Avail: NTIS HC \$12.75

Characteristics and advantages of a flapping wing engine patterned after wings found in nature are described, based on results obtained in an investigation of the hydrodynamics of a flapping wing on a specially designed oscillatory apparatus. A mathematical analysis of the kinematics is presented. The results of an approximation of the induced velocities from the eddy wakes of a flapping wing and a screw engine indicate that the losses in creating induced velocities in the entire variable range of the stepped angle are greater for a screw than for a wing.

INITIAL OPERATING EXPERIENCE WITH AN AIRCRAFT SIMULATOR HAVING EXTENSIVE LATERAL MOTION

Richard S. Bray May 1972 27 p refs

(NASA-TM-X-62155) Avail: NTIS HC \$3.50 CSCL 14B

The flight simulation facility features an extensive cockpit motion system, emphasizing lateral motion for the simulation of lateral-directional control tasks. The motion capabilities of the simulator are briefly described, and the logic with which the motion drives are controlled to provide the most effective approximations of the motions of flight is discussed. Preliminary assessments of the effectiveness of these motions, in the simulation of large transport aircraft, are discussed. Author

SITING CRITERIA FOR INSTRUMENT LANDING SYSTEMS
 7 Jun. 1971 182 p

(DOT-FAA-6750.16) Avail: NTIS HC \$11.25

Criteria for the installation of instrument landing systems are presented. The choice of the runway to be served is based on the following factors: (1) runway length and width, (2) compliance with minimum obstruction clearance regulations, (3) alignment with respect to the prevailing low visibility wind, (4) orientation with respect to the traffic approaches of the airport and the airways concerned, and (5) missed approach

procedure. The effects of siting on the operation of the instrument landing system are examined. Typical instrument landing system installations are illustrated. Author

DETERMINATION OF NOISE EXPOSURE AROUND AN AIRPORT

Juichi Igarashi and Gen Nishinomiya (Japan Broadcasting Corp.) Mar. 1972 18 p refs (ISAS-476-Vol-37-No-2) Avail: NTIS HC \$3.00

A study of drawing the noise exposure contour around an airport is presented. The contour was figured out from measured data obtained in the vicinity of Osaka airport. It is compared with the calculated contour based on data of FAA, the specified flight paths and scheduled operations similar to those of the period of measurements. The methods of determination of PNdb, duration and tone corrections are also mentioned together with the relation between PNdb and db(D) or db(A). Author

EUROPEAN SCIENTIFIC NOTES, VOLUME 26, NUMBER 1 Seymour Hess and Victoria Hewitson 31 Jan. 1972 31 p refs (AD-737607; ONRL-26-1) Avail: NTIS CSCL 14/2

The report is a monthly publication presenting brief articles concerning recent developments in European scientific research. It is hoped that these articles (which do not constitute part of the scientific literature) may prove of value to American scientists by disclosing interesting information well in advance of the usual scientific publications. The articles are written by members of the scientific staff of ONRL, with an occasional article contributed by a visiting stateside scientist. Author (GRA)

N72-24357# Cornell Aeronautical Lab., Inc., Buffalo, N.Y. TOTAL IN-FLIGHT SIMULATOR (TIFS), PRELIMINARY DESIGN REPORT Final Report, Nov. 1966 - Jun. 1967

Wright-Patterson AFB, Ohio AFFDL Aug. 1971 262 p refs (Contract F33615-67-C-1157; AF Proj. 6848) (AD-738314; AFFDL-TR-71-119) Avail: NTIS CSCL 14/2

The TIFS research airplane, the most advanced in-flight simulation vehicle yet developed, was designed to provide Total In-Flight Simulation. This capability depends on two basic features of the aircraft. First is the addition of an evaluation cockpit which is entirely separate from the normal airplane's safety pilot's cockpit. Second is the control by a variable stability system of not only the moments about all three axes, but also the forces acting along the three axes. The report describes the TIFS airplane development during the period from November 1966 to June 1967. Author (GRA)

AN ANALYSIS OF A TWO-DIMENSIONAL PROPULSION WING Ph.D. Thesis

Galen Hu 1971 120 p

Avail: Univ. Microfilms Order No. 71-23518

A numerical method of solution using distributed surface singularities was developed to solve the potential flow problem of a two-dimensional airfoil with distributed suction over part of its upper surface and a thin jet issuing from a general point of the lower surface. The fluid at the trailing edge is assumed to separate as a free streamline forming a constant pressure wake region between it and the jet. The shapes of the free streamline and the jet, a priori unknown, constitute part of the solution. Several cases were calculated for different jet strengths with or without suction. The agreement of the numerical results with some limited experimental data with a jet, but no suction, is fair. This might be partly attributed to leading edge separation observed during the experiment. Dissert. Abstr.

AN APPARATUS FOR THE AUTOMATED RECORDING OF INFRARED SPECTRA OF GASEOUS SAMPLES FROM LIQUID OXYGEN

F. H. Meppelder Jul. 1971 24 p ref

(CL-1971-16; TDCK-58312) Avail: NTIS HC \$3.25

An electromechanical device is described which automatically performs the manipulations necessary for recording the infrared spectra of a series of gaseous oxygen samples. A spectrum of each sample at 10 atm, or any other adjustable lower value and a spectrum at 1 atm, are recorded. The reliability of the

apparatus is such that a series of 10 samples can be handled unattended. The automate was developed for the analysis of trace contaminants in aviator's breathing oxygen; some other fields of application are indicated. Author

APPLICATION OF POLYIMIDE ACTUATOR ROD SEALS

A. W. Watermann, B. F. Gay, E. D. Robinson, S. K. Srinath, and W. G. Nelson 30 Jan. 1972 177 p refs

(Contract NAS3-14317)

(NASA-CR-120878; D6-54351) Avail: NTIS HC \$11.00 CSCL 11A

Development of polyimide two-stage hydraulic actuator rod seals for application in high-performance aircraft was accomplished. The significant portion of the effort was concentrated on optimization of the chevron and K-section second-stage seal geometries to satisfy the requirements for operation at 450 K (350 F) with dynamic pressure loads varying between 200 psig steady-state and 1500 psig impulse cycling. Particular significance was placed on reducing seal gland dimension by efficiently utilizing the fatigue allowables of polyimide materials. Other objectives included investigation of pressure balancing techniques for first-stage polyimide rod seals for 4000 psig 450 K (350 F) environment and fabrication of a modular retainer for the two-stage combination. Seals were fabricated in 0.0254 m (.10in.) and 0.0635 m (2.5in.) sizes and tested for structural integrity, frictional resistance, and endurance life. Test results showed that carefully designed second stages using polyimides could be made to satisfy the dynamic return pressure requirements of applications in high-performance aircraft. High wear under full system pressure indicated that further research is necessary to obtain an acceptable first-stage design. The modular retainer was successfully tested and showed potential for new actuator applications. Author

DETERMINATION OF THE LIFETIME OF HELICOPTER COMPONENTS

R. Prinz Washington NASA May 1972 77 p refs Transl. into ENGLISH from Proc. of DGLR Symp. on Helicopters and Propellers, Immenstaad, West Germany, 24 Jun. 1969 (Contract NASw-2035)

(NASA-TT-F-14280) Avail: NTIS HC \$6.00 CSCL 14D

Methods which are used, or are to be used in the future, for determining the lifetime of helicopter components are discussed. These methods are based on the determination of the working stress. Calculated or measured stress-time functions are studied, and both analytical and experimental methods are given for the statistical evaluation of these functions. The use of a unit collective for fatigue studies on rotor blades is also recommended, on the basis of various stress collectives reported in the bibliography. This unit collective can serve as the basis for fatigue studies. Some possibilities for carrying out fatigue studies are stated, and the necessity for statistical evaluation of test results is mentioned. Some methods for determining lifetime on the basis of the fluctuating stresses are presented. Author

EVALUATION OF SELF-SEALING BREAKAWAY VALVES FOR CRASHWORTHY AIRCRAFT FUEL SYSTEMS Final Report

Bruce Anson Fort Eustis, Va. USAAMRDL Nov. 1971 75 p

(Contract DAAJ02-70-C-0038; DAAJ02-67-C-0004; DA Proj. 1F1-64204-D-154)

(AD-738204; Rept-4820-71-25; USAAMRDL-TR-71-65) Avail: NTIS CSCL 13/11

A program was aimed at improving the component performance characteristics of breakaway valves used to eliminate fuel spillage and subsequent fire in otherwise survivable aircraft crashes. It consisted of an initial study and literature survey to establish the state of the art followed by two series of static and dynamic tests of various types of valves to define problem areas and to verify that the problems had been corrected. An analysis to correct the indicated deficiencies was accomplished between the two test phases. The results were then collated into a draft military specification. GRA

COMPARISON OF EXPERIMENTAL AND THEORETICAL THERMAL FATIGUE LIVES FOR FIVE NICKEL BASE ALLOYS

David A. Spera [1972] 12 p refs Presented at Symp. on Fatigue at Elevated Temp., Storrs, Conn., 18-23 Jun. 1972

(NASA-TM-X-68051; E-6852) Avail: NTIS HC \$3.00 CSCL 11F

The alloys Nimonic 90, IN 100, coated IN 100, B 1900, coated B 1900, MAR M200, and MAR M200DS (directionally solidified) were studied. Maximum temperatures ranged from 770 C to 1120 C (1420 F to 2050 F). Specimen geometries included tapered disks, double-edged wedges, and cambered airfoils. The disks and wedges were heated and cooled in fluidized beds. The airfoil specimens were heated by a Mach 1 natural gas burner and rapid-air-cooled, with and without spanwise loading. Life calculations included two distinct failure modes: conventional low cycle fatigue and cyclic creep. Required material properties were limited to conventional thermal, tensile,

and creep rupture data. The complete life calculation system included the calculation of transient temperature distributions, thermal strains, stresses, creep damage, fatigue damage, and cycles to first crack. Calculated lives were within a factor of two for 76 of the 86 data points analyzed. Cyclic creep accounted for 81% of all the calculated damage. Author

I. I. Ishchenko, V. I. Omelchenko, B. N. Sinayskiy, A. D. Pogrebnyak, P. S. Banas, and M. I. Reznik 12 May 1972 11 p refs Transl. into ENGLISH from Prob. Prochnosti (USSR), no. 10, 1971 p 76-81
(JPRS-55972) Avail: NTIS HC \$3.00

Data are presented on the influence of certain types of oxidation-resistant coatings on the fatigue strength of the nickel-based alloy ZhS6K, which is extensively used for vanes of aviation turbine engines. It is concluded that oxidation-resistant coatings (powder calorizing, calorizing, and aluminosirconizing with paint) had no influence on the fatigue strength of ZhS6K specimens not subjected to preliminary heating, and that the coatings increase the fatigue strength of the alloy when subjected to preliminary soaking at 950 degrees C for 1,000 hours. It is shown that the types of coatings investigated provide an increase in the fatigue strength of specimens after preliminary soaking at high temperature over unprotected specimens. Author

PROCEDURE FOR ESTIMATING STABILITY AND CONTROL PARAMETERS FROM FLIGHT TEST DATA BY USING MAXIMUM LIKELIHOOD METHODS EMPLOYING A REAL-TIME DIGITAL SYSTEM

Randall D. Grove, Roland L. Bowles, and Stanley C. Mayhew (Electronic Associates, Inc.) Washington May 1972 57 p refs
(NASA-TN-D-6735; L-8178) Avail: NTIS HC \$3.00 CSCL 12A

A maximum likelihood parameter estimation procedure and program were developed for the extraction of the stability and control derivatives of aircraft from flight test data. Nonlinear six-degree-of-freedom equations describing aircraft dynamics were used to derive sensitivity equations for quasilinearization. The maximum likelihood function with quasilinearization was used to derive the parameter change equations, the covariance matrices for the parameters and measurement noise, and the performance index function. The maximum likelihood estimator was mechanized into an iterative estimation procedure utilizing a real time digital computer and graphic display system. This program was developed for 8 measured state variables and 40 parameters. Test cases were conducted with simulated data for validation of the estimation procedure and program. The program was applied to a V/STOL tilt wing aircraft, a military fighter airplane, and a light single engine airplane. The particular nonlinear equations of motion, derivation of the sensitivity equations, addition of accelerations into the algorithm, operational features of the real time digital system, and test cases are described. FACTORS INFLUENCING CAPACITY AND EFFICIENCY IN AIR TRAFFIC CONTROL Interim Report, Nov. 1970 - Oct. 1971

G. Raisbeck Nov. 1971 90 p refs
(Contract DOT-FA70WA-2141)

(AD-737513; FAA-RD-71-107) Avail: NTIS CSCL 17/7

Most of the report is devoted to a systematic catalogue of measurable quantities which can be related to capacity and efficiency. Each item is described to show how it affects capacity and efficiency and how it interacts with the other factors. Certain current research and development activities and the interests of some user groups have been related to the various categories of factors. Those particular groups of factors which stand out are discussed because of their absolute importance and because of the number of ways in which they interrelate to one another and to other factors. It is concluded that such a catalogue can be used to strengthen support for

research and exploratory development; shaping demand must be treated jointly with increasing capacity rather than as though it were independent; and a number of specific programs of observation and experiment can be inferred, the execution of which would give additional information about the effects on capacity which many of these factors might have. CORRELATION OF TOTAL SOUND POWER AND PEAK SIDELINE OASPL FROM JET EXHAUSTS

Uwe H. vonGlahn [1972] 10 p refs Presented at 5th Fluid and Plasma Dyn. Meeting, Boston, 26-28 Jun., 1972; Sponsored by Am. Inst. of Aeron. and Astronaut.
(NASA-TM-X-68059; E-6921) Avail: NTIS HC \$3.00 CSCL 20A

An empirical analysis of jet noise is made for convergent exhaust nozzles. An engineering approach to the correlation of total sound power and maximum sideline overall sound pressure level (OASPL), at 200 ft, is presented for both subsonic and supersonic jets based on available data. Data correlation for subsonic jets shows no dependency of total sound power and maximum sideline OASPL on jet density. The analysis for supersonic jets results in a correlation parameter for jet total sound power consisting of the conventional Lighthill parameter modified by considerations of jet Mach number and jet acoustic velocity. Similar parameters also correlate the maximum sideline OASPL for supersonic jets. Author

RESEARCH ON HYDROCARBON FUELS AND RELATED APPLICATIONS Technical Report, 1 Dec. 1970 - 30 Nov. 1971

Robert K. Johnson, Charles M. Monita et al Wright-Patterson AFB, Ohio AFAPL Jan. 1972 82 p refs
(Contract F33615-69-C-1231; AF Proj. 3048; AF Proj. 3066)
(AD-737833; SWRI-RS-581; AFAPL-TR-70-5-Pt-3) Avail: NTIS CSCL 21/4

Studies of the effects of various materials on jet fuel stability were made. Studies of equipment and procedure for rating fuel stability dealt primarily with the JFTOT fuel coker and with methods of polishing heater tubes for use in other fuel cokers. Fuel lubricity was investigated by means of a simulator measuring the starting friction of a valve spool; major sources of error have been identified and recommendations made for a minimum redesign. Fuel corrosion inhibitors were evaluated. Short-term studies have been made of analytical methods for fuel system icing inhibitor and oxygen content of fuels, along with investigation of fuel dyes, fuel compatibility of plastics, fuel acid number determinations, and calibration of the water separator (WSIM) apparatus. Operation of an existing information retrieval system has been continued, and jet fuel property data from world-wide procurement processed and analyzed. GRA

MECHANISM OF MIXING OF TWO NONREACTING GASES Ph.D. Thesis

Paul James Ortwerth 1971 158 p
Avail: Univ. Microfilms Order No. 71-22518

The turbulence phenomena associated with the mixing of fuel and air in a supersonic combustion ramjet were studied. The turbulence generated by coaxial and normal jet fuel injection was studied by analyzing a control volume in which fuel and air are mixed. These two modes of fuel injection were examined for various initial conditions in order to compare their respective characteristics and determine the design advantages of each mode. The results of this analysis show that large turbulence energies can be generated, much larger than the energy added by the jet. A universal plot for a diatomic gas $\gamma = 1.4$ was determined for which specific impulse losses are found to be a function of relative turbulence intensity and flight speed. Experimental results from a compressible turbulent shear flow experiment, the decay of a supersonic free jet were used in

formulating a new theoretical model for turbulent shear flow. A fuel injector designed to maximize the turbulent kinetic energy was tested to verify the existing mixing rate correlations.

PRELIMINARY PERFORMANCE OF A LOW LOADING HIGH TIP SPEED FAN STAGE

Everett E. Bailey Mar. 1972 11 p ref
 (NASA-TM-X-68027; E-6826) Avail: NTIS HC \$3.00 CSCL 21E

Limited data indicates the feasibility of designing fan stages for operation with weak oblique shocks in the rotor blade tip region. A 1600 ft/sec rotor tip speed fan indicated an overall efficiency of 0.846 at a pressure ratio of 1.51 even though the rotor blades had incurred damage in the leading edge tip region prior to obtaining the design speed performance. After the test it was observed that a number of the rotor blade mid-span dampers had failed, subsequently damaging a number of rotor blades in the leading edge tip region. Author

INVESTIGATION OF FAILURE OF GAS TURBINE VANES UNDER INFLUENCE OF THERMAL CYCLES

G. N. Tretyachenko *In its* Gas Turbine Vanes 8 May 1972 p 1-13 refs

Avail: NTIS HC \$3.25

The basic principles of failure for gas turbine engines were studied by investigating short-term thermal cycles in turbine vane models. The effect was studied of mechanical loads including vibration and tensile loads that develop during rotor rotation due to centrifugal forces on thermal cracking. It is concluded that vane failure is governed by: (1) chemical reaction of surface layers with fuel combustion products; (2) accumulation of cyclic deformations at the edges due to thermal stresses occurring during heating and cooling; and (3) cyclic stresses due to vibration. F.O.S.

A CERAMIC THERMAL BARRIER FOR HIGH TEMPERATURE ENGINE COMPONENTS

R. L. Newman, K. R. Cross, W. C. Spicer, H. D. Sheets (Battelle Mem. Inst., St. Louis, Mo.), and T. D. Driskell (Battelle Mem. Inst., St. Louis, Mo.) Sep. 1971 66 p refs Backup document for AIAA Synoptic, "Application of Thermal Barriers to High Temperature Engine Components", scheduled for publication in Journal of Aircraft in Sep. 1972

(Rept-21-C-71F) Avail: NTIS HC \$5.50

Cooling systems for controlling the structural temperatures of turbine engines are discussed. The thermal barrier, a low conductivity coating, is a means of reducing the cooling requirements. The chief benefit of the thermal barrier will be in saving the cooling air. The relative merits of a thin, monolithic structure and a thick reinforced structure are examined. A test program to match or exceed engine conditions with selected ceramic systems is included. The materials tested were alumina (high shock resistance), zirconia (low thermal conductivity), and zircon foam (very low conductivity). Author

FATIGUE STRENGTH OF MODELS OF GAS TURBINE VANES DURING PROGRAMMED TEMPERATURE CHANGE APPROXIMATING THE OPTIONAL CHANGE

B. N. Sinayskiy *In its* Increase in Reliability of Gas Turbine Engines 15 May 1972 p 62-68 refs

Avail: NTIS HC \$3.25

The fatigue strength and durability of vane models were investigated under isothermal conditions and with programmed temperature changes, simulating the thermal conditions of working turbine vanes. For reproducing static tensile stresses produced by centrifugal forces during fatigue tests, the vane model was made in the form of a double closed model of a working turbine vane, fabricated from cast refractory nickel-based ZhS6K alloy. Smooth cylindrical specimens of the same alloy, 9 mm in diameter, were tested to obtain comparative characteristics of fatigue strength and durability. Author

LF467 CONCEPT DEFINITION

Jan. 1972 121 p refs

(Contract NAS3-15690)

(NASA-CR-120909; R72-AEG-207) Avail: NTIS HC \$8.25 CSCL 21A

The LF467 concept is discussed. The LF467 is an advanced turboprop lift fan intended for application with the YJ97-GE-100 turbojet gas generator on a V/STOL transport research aircraft. The program objective was to define a fan that develops a reasonably high (1.30) fan pressure ratio consistent with propulsion requirements of a V/STOL research transport aircraft and that exhibits the ability to achieve a 100 PNdE overall noise objective through the use of modest additional installation treatment. The aerodynamic and mechanical designs of this system and the resulting configuration, weight, and noise predictions are presented. Author

DRIVE TURBINE SYSTEMS FOR 20-INCH TURBOFAN

SIMULATORS. 1: DUCT TURBINE DESIGN

Warren J. Whitney May 1972 18 p refs
(NASA-TM-X-68081; E-6972) Avail: NTIS HC \$3.00 CSCL 21E

A study was made to evolve the turbine drive systems for 20-inch turbofan engine simulators. The fan designs used in the simulators included single-stage and two-stage configurations that covered a wide range of rotative speed and power requirement. The objective assumed for the study was to evolve one core turbine design that could drive all of the single-stage fans and, when operated in combination with one duct turbine design, drive all of the two-stage fans. The duct turbine power output is then needed to determine the make-up power required of the core turbine over the range of two-stage fan operating conditions. The duct turbine design analysis is reported and includes the selection of the duct turbine velocity diagram, a description of the blade design, and a determination of its off-design performance. Adjustable stators were found to be quite advantageous to the duct turbine off-design operation. The use of adjustable stators enabled the duct turbine to accommodate fan mass flow at all operating points and caused the duct turbine power output to increase as the total power requirement increased. This in turn resulted in a core turbine make-up power requirement that was not significantly greater than that required for driving the single-stage fans. Author

REVIEW OF JET ENGINE EMISSIONS

Jack Grobman 1972 17 p refs Presented at the DOT Surv. Conf., Climatic Impact Assessment Program, Cambridge, Mass., 15-16 Feb. 1972
(NASA-TM-X-68064; E-6938) Avail: NTIS HC \$3.00 CSCL 21E

A review of the emission characteristics of jet engines is presented. The sources and concentrations of the various constituents in the engine exhaust and the influence of engine operating conditions on emissions are discussed. Cruise emissions to be expected from supersonic engines are compared with emissions from subsonic engines. The basic operating principles of the gas turbine combustor are reviewed together with the effects of combustor operating conditions on emissions. The performance criteria that determine the design of gas turbine combustors are discussed. Combustor design techniques are considered that may be used to reduce emissions. Author

ECONOMIC STUDIES: CAPITAL COST ANALYSIS OF AIRPORT ALTERNATIVES

Oct. 1971 160 p ref Sponsored in parts by FAA and HUD

Avail: NTIS HC \$10.00

A series of airport alternative for the San Francisco Bay area was reviewed for cost and then considered on a present value basis to allow further assessments when weighed against anticipated income and other benefits. Cost data were accumulated on current and projected bases, and order-of-magnitude cost estimates were made for 37 alternative airport expansion projects at 20 airports. The expansion of general aviation airports was estimated by using existing master plans which included adding a second runway or extending an existing one, and adding taxiways, tie-down areas, aprons, or a tower. Rapid transit connections were included in commercial airport projects. The projects varied in cost because of expensive fill and diking requirements. The major components of the project are land, building construction, and heavy construction. These are considered, along with the effects of their different rates of escalation. N.E.N.

ANALYSIS OF A CIRCULATION CONTROLLED ELLIPTICAL AIRFOIL Ph.D. Thesis

Jack Peter Ambrosiani 1971 184 p

Avail: Univ. Microfilms Order No. 71-26650

A theoretical analysis on a 20% thickness/chord ellipse with circulation control by tangential trailing edge blowing is considered. The analysis yields the sectional lift and drag coefficients for given ambient conditions, flight conditions, and prescribed blowing reservoir conditions. The method of solution is an iterative one, and involves the matching of an assumed sectional lift coefficient with the sectional lift coefficient calculated from the actual pressure distribution over the body in the presence of trailing edge blowing. In order to obtain the pressure on the wall in the wall jet region a full-boundary layer analysis is required over the airfoil. The Karman-Pohlhausen integral method is used in the laminar region and the Nash and Hicks turbulent layer analysis is used in the turbulent region. This analysis confirms the feasibility of obtaining high lift coefficients with relatively low blowing rates. Dissert. Abstr.

A VORTEX MODEL DEALING WITH THE AIRSTREAM AT THE ROTOR BLADE OF A HELICOPTER

W. H. Isay Washington NASA Apr. 1972 55 p refs Transl. into ENGLISH from "Ein Wirbelmodell zur Behandlung der Stroemung am Rotorblatt eines Hubschraubers", Inst. for Shipbuilding of the Univ. of Hamburg, report No. 272, Jul. 1971 (Contract NASw-2037)

(NASA-TT-F-14228; Rept-272) Avail: NTIS HC \$4.75 CSCL 01A

With the aid of the nonstationary vortex line-support theory an approximate method is given for calculating the buoyancy distribution at rotor blades in forward flight. The theory presented takes into consideration, with reference to vortex geometry, a nonuniform (especially trapezoidal) flow through the plane of the rotor, as well as the unrolling process and the contraction of the free transverse vortex. In the determination of the circulation distribution of the rotor airflow, a special case is treated where the blades penetrate the unrolled and contracted tip vortex and root vortex of the sometimes forward-driving airfoils. Formulas for computing acoustic pressure fields radiated from a rotor (compressible treatment) are included. Author

PREDICTION OF UNSTEADY AERODYNAMIC LOADINGS CAUSED BY TRAILING EDGE CONTROL SURFACE MOTIONS IN SUBSONIC COMPRESSIBLE FLOW: ANALYSIS AND RESULTS

W. S. Rowe, B. A. Winther, and M. C. Redman Washington NASA Jun. 1972 77 p refs

(Contract NAS1-10536)

(NASA-CR-2003) Avail: NTIS HC \$3.00 CSCL 01A

A theoretical analysis and a computer program have been developed for the prediction of unsteady lifting surface loadings caused by motions of trailing edge control surfaces having sealed gaps. The final form of the downwash integral equation has been formulated by isolating the singularities from the non-singular terms and establishing a preferred solution process to remove and evaluate the downwash discontinuities in a systematic manner. Comparisons of theoretical and experimental pressure data are made for several control surface configurations. The comparisons indicate that reasonably accurate theoretical pressure distributions and generalized forces may be obtained for a wide variety of control surface configurations. Spanwise symmetry or antisymmetry of motion, and up to four control surfaces on each half span can be accommodated. Author

A DYNAMICAL THEORY OF FLUTTER

A. E. Billington May 1971 14 p refs

(ARL/SM-332) Avail: NTIS HC \$3.00

It is argued that no truly dynamical theory of flutter has been propounded. Ideas are limited to the elementary case of translation and rotation of a rigid wing. The motion of the wing and the motion of the air are incorporated in the one dynamical system. When the linear and angular deviations of the wing about a straight line fixed in space are small and when its motion is uniform in the absence of such deviations, the position of the wing is at any time determined by the solution functions of two simultaneous second order linear differential equations. These equations have constant coefficients when the motion is referred to moving axes fixed in the wing. The inclusion of a circulation term renders the equations nonhomogeneous by reason of its independence of motion and configuration. This term is reinterpreted as a periodic forcing function of the finite dynamical system represented by the equations. The amplitude and phase of the forcing function are synchronized with the circulation of an initial fluid motion--one intended to correspond to the onset of a flutter instability--in which the magnitude of the circulation is fixed by the Joukowski condition and in which the

time rate of variation of the circulation is zero. These two conditions coupled with those of initially zero displacement variables constitute the four initial conditions to be satisfied by the solution of the pair of differential equations. Author

AN INVESTIGATION OF ANNULAR AEROFOILS FOR TURBOFAN ENGINE COWLS

C. Young London ARC 1972 91 p refs Supersedes RAE-TR-69285; ARC-32241 (ARC-R/M-3688) Avail: NTIS HC \$6.75; HMSO £3.27; PHI \$12.95

The annular aerofoils suitable for use as short fan cowls on turbofan engines of high bypass ratio have been tested at zero incidence over a range of subsonic Mach numbers and also in static conditions. Comparisons are presented with experimental results from a conventional type of pipe rig, and with predictions from a linearized and a nonlinearized theory. The results show that the effect of the cowl afterbody is fairly small and can be calculated theoretically. Both types of theoretical methods give good predictions of the surface pressure distribution, but the comparison between theoretical and measured mass flow through the cowl deteriorates as Mach number increases. The response of a 4-stage axial flow compressor with a hub/tip ratio of 0.8 is investigated with a 60 deg square wave inlet distortion and with a triangular spoiler configuration inlet distortion. By measuring the total pressures, static pressures, and yaw angles behind each stage, the development of the distortion is followed through the compressor. ESRO

N72-25001 Washington Univ., St. Louis, Mo. **THE METHOD OF MULTIBLADE COORDINATES IN THE LINEAR ANALYSIS OF LIFTING ROTOR STABILITY AND GUST RESPONSE** Ph.D. Thesis

Sheng-Kuang Yin 1971 202 p
Avail: Univ. Microfilms Order No. 71-27371

The dynamic linearized or perturbation problem of a lifting rotor with rigid flapping blades having elastic restraints, with rigid hub and with four types of control feedback is solved for low and high rotor advance ratios with the method of multiblade generalized coordinates, using the Floquet state transition matrix. While previous applications of multiblade coordinates were limited to the use of the first cyclic flapping or in-plane modes and to constant coefficient rotor representations, the present

study extends this work to include coning, differential coning and warping rotor modes and considers the periodicity of the coefficients in the dynamic rotor equations. The conventional modal columns now become time functions. Numerical examples assuming several blades per rotor show considerable differences in the modal function columns and in the gain factors at the stability limits depending on the number of blades.

ANNUAL REVIEW OF AIRCRAFT ACCIDENT DATA: US GENERAL AVIATION, CALENDAR YEAR 1969

28 Apr. 1971 155 p
(NTSB-ARG-71-1) Avail: NTIS HC \$9.75

The Annual Review of Aircraft Accident Data is a statistical compilation published by the National Transportation Safety Board. The publication contains statistical information compiled from reports of 4,767 general aviation accidents that occurred during the calendar year 1969. Included in the total number of accidents are 45 collisions between aircraft. By coding each aircraft involved in the collisions, an additional 45 records are produced, bringing the total accidents records to 4,812. This figure reflects the true number of pilots and aircraft involved in the accidents.

AIRCRAFT ACCIDENT REPORT, SOUTHERN AIRWAYS,

INCORPORATED, DC-9, N97S, TRI-STATE AIRPORT, HUNTINGTON, WEST VIRGINIA, 14 NOVEMBER 1970
14 Nov. 1970 80 p

(NTSB-AAR-72-11) Avail: NTIS HC \$6.00

A DC-9, N97S, operating as a charter flight, crashed during a landing attempt at the Tri-State Airport, Huntington, West Virginia, on November 14, 1970. All 75 occupants, including 71 passengers and four crewmembers, were fatally injured. The aircraft was destroyed. The flight was attempting a nonprecision instrument landing approach at the time of the accident. The crash occurred following impact with trees on a hill approximately 1 mile west of the runway threshold. The probable cause of this accident was the descent below minimum descent altitude during a nonprecision approach under adverse operating conditions, without visual contact with the runway environment. The Board has been unable to determine the reason for this descent although the two most likely explanations are (1) improper use of cockpit instrumentation data, or (2) an altimetry system error. EC-130E RADOME COMPATIBILITY TEST

Richard Solem and Philip P. Panzarella Oct. 1971 37 p

(ENEA-71-45) Avail: NTIS HC \$4.00

The results of flight tests for determining the effects of installing an X band nose radome in an EC-130E aircraft are reported for takeoff, climb, and cruise. The changes in stability and control characteristics of the modified aircraft were also investigated. It was found that the redesigned nose section changed the airspeed error correction at takeoff by one knot, and by four knots for the landing configuration. The stall speed is also four knots higher than for the basic C-130E. The degradation in cruise performance was 10 to 11% and for climb performance was 15 to 16%. It is recommended that the air speed calibration data be used to update flight manuals, and that performance flight tests be conducted to determine the degradation within + or - 1%. F.O.S.

VORTEX OBSERVATIONS BY THE XONICS ACOUSTIC RADAR AT NAFEC Final Report

Martin Balser, Arthur E. Nagy, and Andrew P. Proudian Dec. 1971 123 p

(Contract DOT-FA71WA-2672)

(FAA-RD-71-103; TR-7) Avail: NTIS HC \$8.25

A series of flight tests was conducted in order to demonstrate feasibility of the concept of the Xonics acoustic vortex detector. The first tests consisted of simultaneous observations in close proximity by both the Xonics equipment and the instrumented tower of vortices shed by a low-flying aircraft. Except for the few cases where data was lost through equipment misalignment or malfunction or operator error, vortex returns were observed on virtually all of the runs. A total of 55 runs, which represents a substantial fraction of all of the data gathered, were selected for analysis. The vortex velocity measurements exhibit a clear correlation with aircraft configuration, and appear to confirm their use as a valid indicator of vortex intensity. Author

A METHOD OF IMPROVING AIRCRAFT GROUND PERFORMANCE IN SLUSH AND WET CONDITIONS

R. V. Barrett London ARC 1972 25 p refs Supersedes ARC-33108

(ARC-CP-1206; ARC-33108) Avail: NTIS HC \$3.25; HMSO 45p; PHI \$1.95

A small wheel placed ahead of an aircraft main landing wheel can effectively clear a path for it through slush or standing water. In this investigation, model pneumatic wheels of 9 in and 3 in diameter were used to determine the effect of the forewheel on the drag and spray from the main wheel and on its aquaplaning characteristics. The model was run at speeds up to 115 ft per sec in a water depth of 0.25 in on a moving runway apparatus. Total wheel drag was reduced by the auxiliary wheel

except at very low speeds, the maximum reduction of nearly 50% occurring just below the normal aquaplaning speed of the main wheel. Aquaplaning of the main wheel only occurred after the auxiliary wheel had aquaplaned. This could be prevented by using a very high auxiliary wheel tyre pressure. The height of the intense region of the main spray plume was considerably reduced. Author (ESRO)

A SIMULATOR STUDY OF DIRECT LIFT CONTROL

A. G. Barnes, D. E. Houghton, and C. Colclough London Aeron. Res. Council 1972 68 p refs

(ARC-CP-1199) Avail: NTIS HC \$5.50; HMSO £1; PHI \$3.90

A fixed base simulator study of direct lift control as applied to the VC-10 aircraft is described. The practical limitations imposed by factors such as the small spoiler authority to control lift, the power control dynamics, and the c.g. range over which the system must operate are included. A degree of improvement in longitudinal handling can be obtained from DLC, but it seems from this work that the most promising arrangement lies in a combination of DLC and a 'manoeuvre boost' input to the elevator. Confirmation by flight trials of the improved performance in the landing flare is needed, because of the difficulties of simulating this phase of flight. Author (ESRO)

STUDY COVERING CALCULATIONS AND ANALYSIS OF SONIC BOOM DURING OPERATIONAL MANEUVERS. VOLUME 1: ANALYSIS AND COMPUTATION OF MANEUVER EFFECTS Final Report, Apr. 1970 - Feb. 1971

Feb. 1971 313 p refs

(Contract DOT-FA70WA-2315)

(AD-735296; D6A-12108-1-Vol-1; EQ-71-2) Avail: NTIS CSCL 01/2

The methods and results of the study of the effects of operational SST maneuvers on sonic boom are contained in three volumes. Volume I shows that the theoretical effects of operational maneuvers due to typical SST maneuvers are small except for maneuvers at Mach numbers below about Mach 1.3. Methods are outlined for applying the results to any airplane, and selected pressure signatures are presented for the U.S. SST and SCAT 15-F. Author (GRA)

FINITE AMPLITUDE WAVES ON AIRCRAFT TRAILING VORTICES

D. W. Moore Oct. 1971 27 p refs

(Contract AF-AFOSR-1804-69; AF Proj. 9781)

(AD-737859; AFOSR-72-0033TR) Avail: NTIS CSCL 01/2

Numerical methods are used to study the growth of waves of finite amplitude on a pair of parallel infinite vortices. The vortices are treated as lines except where the detailed structure of the core is needed to remove consistently the singularity in the line integrals for the velocities of the vortices. It is shown that the vortices eventually touch and the shape of the wave at this instant is calculated. Wave distortion and gross properties are related to linear theory. GRA

AIRCRAFT INCIDENT REPORT: NORTHEAST AIRLINES, INCORPORATED, MCDONNELL DOUGLAS DC-9-31, N982NE, MARTHA'S VINEYARD, MASSACHUSETTS, 22 JUNE 1971

29 Dec. 1971 19 p

(PB-207101; NTSB-AAR-72-4) Avail: NTIS HC \$3.00 CSCL 01B

On June 22, 1971, a DC-9-31 struck the water during a

nonprecision instrument approach and received minor damage. There were no injuries to the three passengers and five crew members aboard the aircraft. The weather at the airport was reported to be: sky obscured; indefinite ceiling 300 feet; visibility 1 mile in fog; wind 030 at 5 knots; and the altimeter was 29.81 inches of mercury. The flight was performing a VOR straight-in approach to Runway 24 at Martha's Vineyard at the time of the incident. The aircraft struck the water approximately 3 miles short of the runway. Minor structural damage was incurred by the lower aft section of both engines. The National Transportation Safety Board determines that the probable cause of this incident was the lack of crew coordination in monitoring the altitude during the performance of a nonprecision instrument approach, the misreading of the altimeter by the captain, and lack of altitude awareness on the part of both pilots. COCKPIT GEOMETRY EVALUATION. VOLUME 1: PROGRAM DESCRIPTION AND SUMMARY Final Report, 1 Feb. - 31 Aug. 1970
 Patrick W. Ryan Nov. 1971 143 p refs
 (Contract N00014-68-C-0289; NR Proj. 213-065)
 (AD-738006; D162-10125-2A-Vol-1; JANAI-701213-Vol-1) Avail: NTIS CSCL 01/3

The Cockpit Geometry Evaluation Program is an experimental development to establish a standardized method for evaluating the physical geometry of a crew station. It evaluates the physical compatibility of a seated crew member of any size with any crew station beginning with the design concept. Data on the geometry of the crew station, the anthropometric characteristics of the crew members, and the sequence of tasks to be performed are stored in a computer. Mathematical routines provide dynamic movement for a variable-sized mathematical man-model. Numerical performance indicators, identification of physical and visual interferences, and reach infeasibilities are output. The crew station compliance with certain MIL-STD and -SPEC requirements is also checked. Volume 1 of the final report summarizes the results and techniques of Phases I, II and II-A. Author (GRA)

 (Contract N00014-68-C-0289; NR Proj. 213-065)
 (AD-738007; D162-10127-2A-Vol-3; JANAI-701214-Vol-3) Avail: NTIS CSCL 01/3

The Cockpit Geometry Evaluation (CGE) Program is a development of improved methods for evaluating the physical compatibility of crew members with crew stations. The heart of the program is a 23-joint, three-dimensional man-model (BOEMAN) that simulates the motion of humans performing tasks in a given environment. The computer program system (CPS) ties the project together. The system uses an updatable bank of anthropological, environmental and task sequence data. The system provides information concerning data consistency, reach capability, crew station compliance to select military standards, locations and orientations of joints and body segments during movement, visual and/or physical interference of

BOEMAN with the crew stations and with himself, numerical performance data on joint displacement and deflection, and mass displacements. Author (GRA)

COCKPIT GEOMETRY EVALUATION. VOLUME 4: MATHEMATICAL MODEL Final Report, 1 Feb. - 31 Aug. 1970
 Michael J. Healy Nov. 1971 110 p refs Revised
 (Contract N00014-68-C-0289; NR Proj. 213-065)
 (AD-738008; D162-10128-2A-Vol-4; JANAI-701215-Vol-4) Avail: NTIS CSCL 01/3

This volume describes the mathematical man-model of Phase II-A of the Cockpit Geometry Evaluation (CGE) Program and replaces the contents of the Phase II volume (D162-10128-2). The CGE Program is developing a computerized method to evaluate the physical compatibility of crew members with crew stations beginning with the conceptual phases of the design. A link system enclosed by geometrical shapes has been developed to date to model any specified sized member of a human population. The majority of the link connecting points represent major joint centers of the body and the geometric shapes, based on anthropometric data, represent body segments. Author (GRA)

COCKPIT GEOMETRY EVALUATION. VOLUME 5: VALIDATION
 Patrick W. Ryan, Harland N. Sather, and Arthur W. Barse Nov. 1971 192 p refs Revised
 (Contract N00014-68-C-0289; NR Proj. 213-065)
 (AD-738009; D162-10129-2A-Vol-5; JANAI-701216) Avail: NTIS CSCL 01/3

The Cockpit Geometry Evaluation (CGE) Program is developing improved methods of evaluating the interaction and compatibility of crew members with crew stations. The main feature is a computer program system (CGECPS) containing a 23-joint, three-dimensional man-model (BOEMAN) which can mathematically simulate human motion. During Phase II-A, an existing cockpit design (A-7E) was partially evaluated by the CGECPS. The results were compared with human factors data and the CGE system correctly analyzed more than 80% of the tasks performed. The validation of the man-model joint movement parameters was also continued in Phase II-A by comparing them with human movement parameters. The comparison results indicated that the Phase II-A man-model developments which were primarily oriented towards improving the computer efficiency of the man-model have also improved the accuracy of the man-model. A location identification system for identifying a particular ground location from among a plurality of ground locations is reported. Each ground location includes a transmitter that transmits a continuous tone signal when the transmitter is activated. Each transmitter also includes a binary encoder for encoding the continuous tone signal at spaced intervals. Each binary code uniquely identifies the particular transmitter with which it is associated. An aircraft flying above ground locations carries a receiver for receiving the continuous tone signal transmitted by an activated transmitter, and a decoder for decoding the binary encoded portion of the signal. A display device is provided for displaying the identity of the ground location determined as a result of decoding the encoded portion of the signal. Official Gazette of the U.S. Patent Office

OUTPUT FILTERS FOR AIRCRAFT TYPE CYCLOCONVERTORS

N. J. Carter Apr. 1971 44 p refs

(RAE-TR-71088; BR26007) Avail: NTIS HC \$4.25

The performance of low-pass filters, suitable for cycloconvertors which might be used for the prime electrical power supply in aircraft is analyzed and discussed. Three types of filter are considered, and a computer program is used to determine the response of the filters when loads of various power factors are applied. The analysis concludes that the L section filter represents the optimum arrangement for cycloconverter applications.

AN INVESTIGATION OF A TWO-DIMENSIONAL PROPULSIVE LIFTING SYSTEM Ph.D. Thesis

Carl Alvin Shollenberger 1971 121 p

Avail: Univ. Microfilms Order No. 71-27109

Several aspects of the nonhomogeneous flow associated with a system combining lifting and propulsive requirements of an aircraft are considered in detail by analytical and experimental methods. The principles governing flow with energy addition are examined. Basic equations and boundary conditions are developed for the complete inviscid and incompressible analysis for the two-dimensional case. The corresponding flow singularities are discussed and the integral equations which completely specify the system are derived. The two special cases of small and large energy addition are considered in detail including solutions. A numerical procedure is developed to solve the full problem including allowance for the wake deflection. Appropriate vorticity forms are used to represent the entire system. An iterative scheme is presented which rapidly converges to a solution for the magnitude and location of the system vorticity distributions. Forces and moments are evaluated on the propulsive lift system.

AIRCRAFT WAKE VORTEX SENSING SYSTEMS

D. Burnham, M. Gorstein, J. N. Hallock, R. Kodis, T. Sullivan, and I. G. McWilliams 30 Jun. 1971 65 p refs

(DOT/TSC Proj. R-2106; DOT-IA-FA-205)

(DOT-TSC-FAA-72-13) Avail: NTIS HC \$5.25

Active and passive techniques are analyzed that could be used to detect and measure air movements associated with wingtip vortex generation within an area or throughout a volume of terminal airspace. Usable techniques are indicated with an appraisal of expected performance and inherent limitations. Results of preliminary feasibility tests employing available technology are presented. The systems studies to be performed on the wake vortex sensing problem are discussed. The major effort is directed toward the location of wake vortex hazard, and the generation of monitoring requirements for safe operation in the airport terminal environment.

VISUALIZATION OF UNSTEADY FLOW OVER OSCILLATING AIRFOILS

George H. Ruiter, Hassan M. Nagib, and Andrew A. Fejer Sep. 1971 39 p refs Presented at Symp. on Turbulence Measurements in Liquids, 2d, Rolla, Mo., 1971

(Contract F44620-69-C-0022; Grant NSF GK-17748; AF Proj. 9560)

(AD-738304; IIT-THEMIS-R71-6; AFOSR-72-0076TR) Avail: NTIS CSCL 20/4

The study is concerned primarily with the complex nature of leading edge flow separation occurring on airfoils oscillating in a uniform flow field at low Reynolds numbers. The flow field past an oscillating airfoil and a fixed airfoil with an oscillating flap were investigated using various visualization techniques in water. The role of mean flow velocity, instantaneous angle of attack, mean angle of attack and amplitude and frequency of oscillation as well as the location of the support point are examined. The

results which were obtained over a range of parameters substantially beyond previous studies include new information regarding the effect of these parameters on the nature and onset of separation.

FLIGHT TEST INSTRUMENTATION SERIES. VOLUME 3: THE MEASUREMENT OF FUEL FLOW

J. T. France Mar. 1972 32 p refs

(AGARDograph-160-Vol-3; AGARD-AG-160-Vol-3) Avail: NTIS HC \$3.75

The main methods of fuel flow measurement are discussed and the prospective user is advised of the factors that should be considered in deciding which type of meter to use and what precautions to take in the installation. Details are given of the three main types of flowmeters in common use, namely: turbine, orifice and angular momentum true mass. The theory of operation of each type of flowmeter is given together with details of accuracy, pressure drop, susceptibility to inlet and outlet conditions, form of output, and other key parameters likely to influence the choice of type of meter to be used. A quick reference summary is provided for the comparison of the performance of the three types of meter and various methods of calibrating flowmeters are discussed. A separate section is devoted to specialist flowmeters which are not in general use, but may have an application in flight test work. Particular emphasis is placed on solid state flowmeters which, due to the need to obtain improved life and reliability, are the subject of much research work.

A FIELD SURVEY OF EMISSIONS FROM AIRCRAFT TURBINE ENGINES

F. W. Cox, F. W. Penn, and J. O. Chase 1972 32 p refs
(BM-R1-7634) Avail: NTIS HC \$3.75

Exhaust emissions were measured from 25 aircraft turbine engines using Jet A fuel. Analytical apparatus, procedures, and results are described. Carbon monoxide, carbon dioxide, nitric oxide, nitrogen dioxide, and aldehydes were measured at engine operating modes representing power levels used in airline operation. Carbon monoxide, hydrocarbon, and aldehyde emissions were highest at idle and lowest at takeoff; oxides of nitrogen were lowest at idle and highest at takeoff. Of the total oxides of nitrogen emitted, nitrogen dioxide constituted from 10 to 100 pct, depending on the exhaust gas temperature. Engines retrofitted with smoke reducing burner cans produced less carbon monoxide, hydrocarbon, and aldehyde emissions, and slightly more oxides of nitrogen than engines with standard burner cans. Anthony F. Souza 3 Jan. 1971 260 p refs
(Contract EPA-68-04-0037)

(PB-207107; APTD-0916) Avail: NTIS CSCL 13B

Emissions from forty-two light aircraft piston engines and twenty-six military gas turbine engines were measured and documented. Piston engine aircraft were leased from local general aviation suppliers and the engine exhaust emissions tested using a ten mode test cycle during a ground run-up. In addition, crankcase ventilation emissions were measured on six engines and mass emission rates were calculated. Exhaust component concentrations and fuel consumption rates were measured at specified engine operating conditions. The exhaust analyzer readings were converted to pollutant concentrations and mass emission rates. The data were analyzed to determine engine-to-engine variations for each model engine, the effect of hot versus cold start, and the role of engine operating parameters. Author (GRA)

EVALUATION OF STOL MODULAR INSTRUMENT LANDING SYSTEM (MODILS) Final Report, May 1970 - Jul. 1971
 Glen D. Adams May 1972 53 p
 (FAA Proj. 320-114-02X)
 (FAA-NA-72-11; FAA-RD-72-4) Avail: NTIS HC \$4.75

The FAA procured two modular instrument landing system (MODILS) ground stations for short take-off and landing (STOL) operational evaluation. MODILS operated at 5.2 GHz (C-band solid-state transmitter), providing localizer and glide slope signals, from a common site, for approach guidance to aircraft equipped with a MODILS receiver. Proportional guidance is provided from 3 to 12 deg elevation and about +30 deg in azimuth. The pilot may select his glide slope angle in increments of 0.1 deg and one of three localizer courses: parallel to runway centerline, 2 deg skew one side and 6 deg skew the other side. The pilot may also select his indicator sensitivities. An integral distance measuring equipment (DME) is included which provides readouts to 0.01 nmi. The system provides good quality guidance signals to adequately support Category I type (200-foot decision height) operations. The consistent DME operating range is about 5 nmi. The monitors are not of commissionable quality due to reliability and stability problems. Author

A REVIEW OF APPROACH AND LANDING GUIDANCE IN RELATION TO CIVIL AND MILITARY OPERATIONAL REQUIREMENTS

J. Benjamin Sep. 1971 112 p refs
 (RAE-TR-71186; BR27181) Avail: NTIS HC \$7.75

Trends and developments in aircraft guidance and the likely long term effect on aircraft instrumentation and operations are reviewed. Several organizations are engaged in the formulation of operational requirements suited to the foreseeable needs of civil and military aviation, and effort was devoted to the development of a variety of techniques applied to guidance using microwaves. These requirements, and the solutions that were conceived, constitute a complex technical, commercial, and political pattern. Author (ESRO)

AN ILS APPROACH PROGRAMME UNIT FOR THE RADIO ENVIRONMENT MONITOR

T. R. G. Lampard Jul. 1971 66 p ref
 (RAE-TR-71145; BR27441) Avail: NTIS HC \$5.50

A program unit is described which is capable of providing appropriate voltage levels into a signal simulator which in turn supplies the necessary RF signal input to the radio environment monitor in such a way as to simulate an ILS approach by an aircraft. The approach can be simulated with or without the various forms of interference which the monitor is capable of detecting. Author (ESRO)

APPLICATION OF THEORETICAL ACOUSTIC TO JET ENGINE NOISE REDUCTION

J. D. Kester and G. F. Pickett [1971] 20 p refs Presented at Conf. on Reduction of Aircraft Noise, Bristol, Engl., 13-14 Jan. 1971 Sponsored in Part by FAA
 Avail: NTIS HC \$3.00

A now classical example of the application of theory to rotor-stator interaction noise is discussed to illustrate how noise

generation, propagation, and reduction data can be obtained from a simple theoretical model. Some of the problems arising from predicting noise levels of interaction tone noise are considered. Some of the more recent work associated with the study of combination tone or multiple pure tone noise is described. This noise is produced in the inlets of turbofan engines whenever the fan blades have supersonic relative tip speeds. Results of large scale fan tests are used to illustrate the physical characteristics of this noise. A mathematical model is introduced that determines the importance of blade shock wave spacing in the noise generation process. Finally, a method of estimating the standard deviation of shock wave spacing is presented and compared with full scale data. Author

GENERAL METHOD FOR COMPUTATION OF THE ACOUSTIC FIELD GENERATED BY AIRCRAFT JETS

Michel Kobrynski 1971 31 p refs In FRENCH: ENGLISH summary (ONERA-NT-187) Avail: NTIS HC \$3.75

A method was developed for computing the noise generated by standing and flying aircraft from known mathematical expressions of the sound pressure in the far acoustic field of a circular, stationary, subsonic jet. An expression representing the local sound pressure generated by stationary or mobile jets and its acoustic spectrum are determined and solved by computer. Computation was carried out for various types of aircraft and for several cases for which the mean discrepancy appeared to be of the same order within angles from - 20 deg to + 100 deg relative to the maximum emission direction. In obtuse angles relative to the jet axis there appears in flight, for fast jet, a systematic increase of the observed global noise levels, as compared to the computed ones, this discrepancy increasing with the flight Mach number. Several assumptions are proposed concerning the interaction phenomena indicated by this method. Author (ESRO)

HYPERSONIC RESEARCH ENGINE PROJECT. PHASE 2: STRUCTURES AND COOLING DEVELOPMENT Interim Technical Report, 3 May - 2 Aug. 1970

L. F. Jilly 1, Sep. 1970 98 p refs

(Contract NAS1-6666)

(NASA-CR-112055; AP-70-6640; ITR-14) Avail: NTIS HC \$7.00 CSCL 21E

The flightweight components were adapted to form the basic engine assembly. The water cooled test adapters for use in wind tunnel tests were fabricated. Commercially available valves were selected for the coolant control system. The simplification of the temperature control concept and of the absence of weight and volume constraints made it possible to use these valves. Various calibration tests are also discussed. J.A.M.

AN ADAPTIVE NARROW BAND FREQUENCY MODULATION VOICE COMMUNICATION SYSTEM

Sheldon Wishna In its Significant Accomplishments in Technol., GSFC, 1970 1972 p 119-121

Avail: NTIS HC \$3.00 CSCL 17B

A narrow band frequency modulation communication system is described which provides for the reception of good quality voice at low carrier-to-noise ratios. The high level of performance is obtained by designing a limiter and phase lock loop combination as a demodulator, so that the bandwidth of the phase lock loop decreases as the carrier level decreases. The system was built for the position location and aircraft communication equipment experiment of the ATS 6 program. Author

PRELIMINARY INVESTIGATION OF THE VIBRATION OF THE WALLS OF THE TEST CELL FOR J-79-11A TURBOJET ENGINE TYPES [VOORONDERZOEK VAN DE TRILLINGEN VAN DE MUREN VAN DE TESTCEL VOOR STRAALMOTOREN VAN HET TYPE J-79-11A BIJ GSMW OP DE VLEGBASIS WOENSDECHT]

6 Aug. 1971 8 p In DUTCH

(TL-1971-11; TDCK-58326) Avail: NTIS HC \$3.00

Measurements of vibration velocities, accelerations, and frequencies on inside and outside walls of a three dimensional place are reported. Results show that the possibility of crack formation exists and should be further explored. Transl. by G.G.

N72-25899# Aeronautical Research Labs., Melbourne (Australia). **THE FATIGUE LIFE OF SAFE LIFE AND FAIL-SAFE STRUCTURES: A STATE-OF-THE-ART REVIEW**
F. H. Hooke Jun. 1971 62 p refs
(ARL/SM-Rept-334) Avail: NTIS HC \$5.25

A review is made of the theory and practice for assessment of safe life and fail-safe structures, and of determinations of safe inspection intervals for fail-safe structures. The problem is one involving statistical variability and estimates are made of the intrinsic uncertainty in defining, for example, scatter factors, safe lives, or probabilities of failure. The greatest uncertainties arise from the inference of population mean, variance and distribution shape parameters from tests on small samples or samples not properly representative of the geometry or the actual service load history. Consideration is given to defining the optimum test load history to represent service conditions. Author

Ugo Ponzi Nov. 1970 15 p refs In ITALIAN; ENGLISH summary
(Rept-32) Avail: NTIS HC \$3.00

Starting with the conductive heat transfer theory according to Broglie's formula, an experimental method is obtained for measuring the heat transfer rate on a hypersonic model. With this method, knowing the $N(2)$ influence coefficients, and the time functions, which can be determined by applying the known heat rate to the model, the heat rates are determined by measuring the temperatures in N points of the model. The method yields the heat transfer rates directly from the temperature measurement. Author

Washington GPO 1972 947 p refs Hearings before Comm. on Sci. and Astronaut., 92d Congr., 2d Sess., No. 17, 18-20 Jan. 1972
Avail: Subcomm. on Aeron. and Space Technol.

The hearings concerning aeronautical research are reported. Topics discussed include: civil aviation R and D (CARD), national transportation policy, industry response to CARD study, aircraft noise abatement, aircraft safety, and short haul aircraft programs. The Airport Operators Council International Policy Handbook is included. F.O.S.

N72-25948# Committee on Commerce (U. S. Senate). **TRANSPORTATION OF GOVERNMENT TRAFFIC BY CIVIL AIR CARRIERS Report to accompany S. 1821**
Cannon Washington GPO 19 Nov. 1971 43 p refs
Presented by Comm. on Com. to 92d Congr., 1st Sess., 19 Nov. 1971
(S-Rept-92-503) Avail: US Capitol, Senate Document Room

A report is presented on the bill to amend the Federal Aviation Act with respect to the transportation of Government passengers and cargo, both military and civilian, by U.S. civil air carriers. The provisions and background of the bill are outlined, and the current and anticipated military and civilian needs are discussed. It is concluded that the Military Airlift Command (MAC) aircraft are in excess of those needed for training and readiness maintenance. The net current costs to the Government would be reduced by using civil carriers for cargo transportation instead of MAC carriers. The strategic airlift capability of the Civil Reserve Air Fleet is essential and must be maintained, and the cost of maintaining it by assuring business to the civil carriers is

far less than the cost of providing and maintaining equivalent capability in MAC. N.E.N.

Stanley R. Mohler and Bobby H. Johnson 1971 134 p refs
Avail: NTIS HC \$8.75

A biography of Wiley Post covering his entire lifetime and accomplishments in the field of aviation is presented. The significant events of his life which are reported are as follows: (1) globe circling flight with Gatty in 1931, (2) solo flight around the world in 1933, (3) development and test of pressure suit for altitude flight, (4) stratosphere flights during 1934 to 1935 time period, and (5) flight to Point Barrow, Alaska with Will Rogers which ended in fatal accident to both men. A large number of photographs are included to supplement the written reports. P.N.F.

N72-25960# Committee on Commerce (U. S. Senate). **TRANSPORTATION OF GOVERNMENT TRAFFIC BY CIVIL AIR CARRIERS**
Washington GPO 1972 157 p refs Hearing on S. 182 before Comm. on Com., 92d Congr., 1st Sess. 24 Jun. and 30 Sep. 1971
Avail: Subcomm. on Aviation

Hearings by the aviation subcommittee on DOD use of civil aircraft are reported. Civil airlines, holding options on air cargo by the military, want an amendment requiring DOD to transport at least 50% of its air cargo with them. Such an amendment is needed, it was argued, because almost all air cargo is presently being shipped by military means; yet these companies were sold rights to the transportation and are losing money. THE PRACTICAL APPLICATION OF MISHAP DATA IN ARMY AIRCRAFT SYSTEM SAFETY PROGRAMS

James T. Darrah, Jr. /n NASA, Washington Govt.-Ind. System Safety Conf. 28 May 1971 p 65-73 ref

Avail: NTIS HC \$16.25 CSCL 13L

The means are discussed by which the the United States Army Board for Aviation Accident Research (USABAAR) now utilizes the vast store of historical accident data in the application of the system safety concept for developmental aircraft USABAAR serves as the central agency for the Army Accident Prevention Program which includes the receipt, processing, and analysis of all data and information related to Army aircraft accident experience. It is pointed out that methods which served the cause of accident prevention so well in the past are no longer adequate and that traditional parameters used to measure mishap experience have become obsolete. USABAAR has developed, and recently put into use, completely revised accident reporting forms which greatly expand the scope and detail of information provided as a result of investigation. This and other factors which have resulted in an improved data system are discussed in detail. D.L.G.

N72-25969*# Martin Marietta Corp., Baltimore, Md.
PILOT SAFETY FOR THE X-24A LIFTING BODY VEHICLE

John Cochrane and Kenneth Graham /n NASA, Washington Govt.-Ind. System Safety Conf. 28 May 1971 p 87-95

Avail: NTIS HC \$16.25 CSCL 13L

The design and operational characteristics of the X-24A are described in detail. Primary emphasis is placed on the safety considerations incorporated in the design and flight test stages. It is pointed out that the inherently high drag of the lifting body configuration together with its relatively low lift/drag ratio, generated considerable concern with respect to the pilot's ability to perform safe landings from gliding flight. The resulting safety procedures taken at each stage of development are discussed. D.L.G.

REQUIREMENTS FOR SYSTEMS SAFETY PROGRAMS AS DELINEATED BY MIL-STD-882

C. O. Miller /n NASA, Washington Govt.-Ind. System Safety Conf. 28 May 1971 p 137-146 refs

Avail: NTIS HC \$16.25 CSCL 13L

A specialized approach, based on MIL-STD-882, to recommended safety features of an air safety program for aircraft manufacturers, is summarized. E.H.W.

SUBJECT INDEX

Typical Subject Index Listing

The subject heading is a key to the subject content of the document. The Notation of Content (NOC), rather than the title of the document, is used to provide a more exact description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the Notation of Content, e.g., N72-11043. Under any one subject heading, the accession numbers are arranged in sequence with the /AA accession numbers appearing first.

A72-31596

Head-up display for aircraft three dimensional sky path observation during navigation and landing, discussing computer units, CRT and image generating subsystems

A72-32042

Navigation for general aviation and navigation training - Conference, Atlanta, February-March 1972

A72-32201

Area navigation requirements by general aviation, discussing random routing, ATC system and aircraft approach spacing

A72-32202

Great circle intermediate waypoint computation method for inertial navigation equipped aircraft

A72-32205

Computerized navigator training simulator for complete array of air navigation instruments, discussing design and human factors

A72-32208

Canadian Armed Forces air navigation training program, noting emphasis on training flights

A72-32209

USAF Academy air navigation training program, discussing systems development course and descriptive and applied astronomy

A72-32210

Fighter bomber Loran-inertial data processing with digital computer to combine navigation, guidance and weapon delivery into fully integrated system

A72-33246

Solid state modular ground based distance measuring equipment /DME/ receiver for en route aircraft navigation and landing

A72-33521

Technical and operational aspects of L-band satellite system for air navigation, discussing verbal communication, direction finding and noise interference problems

A72-34138

Development of air traffic control procedure using inertial navigation position reports as input data for computer graphics presentation [FAA-RD-71-92]

N72-24673

Concepts, philosophy, and development of minimum operational characteristics for airborne navigation systems [DO-149]

N72-25603

AIR POLLUTION

Climatic changes due to stratospheric perturbation by propulsion effluents of high altitude aircraft flights [AIAA PAPER 72-658]

A72-34076

Air pollution for peak traffic periods at Heathrow Airport, London, for April through September for 1970

N72-24649

Analysis of emissions from aircraft piston and gas turbine engines - tables [PB-207107]

N72-25589

AIR TRAFFIC

Airport capacity and air traffic congestion effects on airport operations in terms of time and costs

A72-32454

Individual regions and nationwide air traffic demands forecasting for airport planning

A72-33311

Major civil airport planning, discussing information gathering and processing for aviation demand, aircraft movements revenue and cost forecasts and pricing policy evaluation

A72-33327

Major civil airport development plan, discussing traffic forecasts, runways, noise, airspace capacity, access systems, freight installations, maintenance facilities, navigation aids, buildings, etc

A72-33328

AIR TRAFFIC CONTROL

ATC systems fast-time simulation, emphasizing importance of human operator performance realistic modeling

A72-32097

ATC procedures training by digital radar simulators, taking into account geographic terrain, radar, wind and aircraft characteristics and flight plans

A72-32098

Area navigation requirements by general aviation, discussing random routing, ATC system and aircraft approach spacing

A72-32202

ATC system organization in terms of optimal operating conditions for civil and military airspace users, discussing navigation systems, human factors, equipment reliability, etc

A72-32455

Aircraft on-time operation and air traffic problems, considering solution requirement formulation and funding suggestions

A72-32462

Integrated civil/military ATC system for upper airspace control /UAC/ center at Karlsruhe

A72-34108

Mediator plan for joint civil/military ATC organization at London center, discussing sectorization, control and radar facilities, flight plan processing and communications

A72-34109

Development of air traffic control procedure using inertial navigation position reports as input data for computer graphics presentation [FAA-RD-71-92]

N72-24673

Analysis of collision hazards involved in VFR flight near clouds and effect of safe vertical clearance from clouds to reduce aircraft accidents [AD-737804]

N72-24682

Catalog on capacity and efficiency of air traffic control systems [AD-737513]

N72-24683

FAA Airport and Airway System unit cost estimates and allocation study

N72-24982

Performance tests of L band communication concepts for air traffic control equipment installed in Applications Technology Satellite-F [NASA-TN-X-65906]

N72-25601

AIR TRANSPORTATION

Hierarchical system of helicopter service terminals, calculating passenger lots for single and multiloop arrangements under given stochastic input conditions

A72-31498

National airports system for UK civil air transportation, discussing economic, operational, accessibility and social aspects

A72-32321

Short haul airlines on-time operation, discussing ATC, weather, cargo and aircraft ground handling, cabin and flight services and aircraft reliability effects

A72-32452

Prediction models for dynamic environment experienced by cargo during air and rail transportation

- Ultrashort haul common carrier air transportation system based on VTOL aircraft for suburban-to-city center trips, comparing with land based transport A72-32610
- VTOL short haul transportation applications discussing concept evolution and economic factors A72-33113
- Flexible wing applications to passenger and cargo transport, discussing gliding and soaring sport, emergency use, powered flight, rocket payload recovery, etc A72-33181
- Buoyancy systems and parawings application in short haul passenger transportation, discussing VTOL and STOL operations A72-33182
- Air cushion landing system application for civil air transportation, discussing operation, braking and parking A72-33183
- Air transportation - SAE/AIAA/ASME Conference, Washington, D.C., May-June 1972 A72-33184
- Airport and air transportation benefits and costs to community and industry, considering institutional, environmental and economic issues A72-33306
- Airport economic and social impact on environs in terms of community development A72-33308
- Short haul air transportation system economic and political problems, noting community acceptance and passenger service standards A72-33309
- Individual regions and nationwide air traffic demands forecasting for airport planning A72-33310
- Commercial airport and air transport service economic impacts on business and industrial communities A72-33311
- Aero engines and propulsion systems development contribution to air transport economics and regularity, considering environmental factors A72-33312
- Commercial transport aircraft engine technology contribution to world air transportation, considering social and ecological compatibility with community A72-33313
- Senate report on transportation of Government civil and military passengers and cargo by civil and military air carriers [S-REPT-92-503] A72-33314
- AIRBORNE EQUIPMENT** N72-25948
- Aircraft industry product support role in time delays minimization for aircraft operators, discussing malfunction report, minimum equipment decision and fault diagnosis A72-32456
- Airborne external instrumentation pod containing IR scanner and associated test equipment for land and water surveys A72-33635
- Digital recording techniques for airborne data acquisition, emphasizing laser beam holographic recorders A72-33642
- Airborne flight test data acquisition system modular design to provide digital readings from monitoring transducers analog signal A72-33645
- AIRBORNE/SPACEBORNE COMPUTERS**
- Avionics equipment for signal processing onboard civil aircraft to improve flight safety, discussing uses of OMEGA navigation system and digital computers A72-31178
- Digital attitude and heading reference system computer for aircraft heading control, discussing design and performance features A72-33244
- Univac 1832 multiprocessor avionics computer for airborne ASW, discussing input/output controllers and interfaces and IC design features A72-33245
- Fighter bomber Loran-inertial data processing with digital computer to combine navigation, guidance and weapon delivery into fully integrated system A72-33246
- AIRCRAFT ACCIDENT INVESTIGATION**
- Practical application of mishap data in Army aircraft system safety programs N72-25967
- AIRCRAFT ACCIDENTS**
- Aircraft accidents involving corporate executive aircraft in US general aviation for calendar year 1970 [NTSB-AMM-72-5] N72-24017
- Aircraft accidents involving air taxi operations in US general aviation for calendar year 1970 [NTSB-AMM-72-4] N72-24018
- Accidents involving rotorcraft in US general aviation for calendar year 1970 [NTSB-AMM-72-3] N72-24019
- Performance of self-sealing breakaway valves in preventing fuel spillage and fires in survival aircraft crashes [AD-738204] N72-24547
- Analysis of US general aviation aircraft accidents for calendar year 1969 N72-25003
- Review of U.S. general aviation accidents for 1969 [NTSB-ARG-71-1] N72-25004
- Aircraft accident involving DC-9 charter flight on instrument landing approach to Huntington, West Virginia airport on 14 November, 1970 [NTSB-AAR-72-11] N72-25006
- Aircraft accident report concerning DC-9 aircraft contact with ocean surface and subsequent emergency landing at Martha's Vineyard, Massachusetts, June 22, 1971 [PB-207101] N72-25013
- AIRCRAFT APPROACH SPACING**
- Area navigation requirements by general aviation, discussing random routing, ATC system and aircraft approach spacing A72-32202
- AIRCRAFT BRAKES**
- Performance tests of aircraft tire under cyclic braking conditions and evaluation of aircraft antiskid braking system [NASA-TN-D-6755] N72-24014
- AIRCRAFT CARRIERS**
- Simulator for physical forces experienced by carrier aircraft during catapult launches and arrested landings, considering external stores safe suspension A72-32620
- AIRCRAFT COMMUNICATION**
- Aeronautical communication satellite technical and economic survey, considering wave propagation, noise, aircraft antennas and VHF and UHF links A72-31180
- AIRCRAFT COMPARTMENTS**
- Development of standardized method for evaluating physical geometry of aircrew stations - Vol. 1 [AD-738006] N72-25015
- Computer programs for improved methods for evaluating physical compatibility of crew members with crew stations - Vol. 3 [AD-738007] N72-25016
- Development of mathematical model for evaluating compatibility of flight crew personnel and aircraft crew stations - Vol. 4 [AD-738008] N72-25017
- Validation of man-model joint movement parameters to determine compatibility of flight crews and aircraft compartments - Vol. 5 [AD-738009] N72-25018
- AIRCRAFT CONFIGURATIONS**
- Relationship between static pressure error /position error/ and measurable flight parameters for different aircraft weights and configurations A72-33637
- Validation of man-model joint movement parameters to determine compatibility of flight crews and aircraft compartments - Vol. 5 [AD-738009] N72-25018
- AIRCRAFT CONTROL**
- Aircraft inertial navigation system, discussing mode selection unit, digital computer and control display for operator communication with system

- L-1011 propulsion, fuel, flight control, navigation, avionics, communication, electrical, environmental control and auxiliary power systems, discussing structure and high lift devices A72-31596
- Aircraft electronic display for pilot precise control in complex tasks, discussing clarity, stability and readability of CRT images A72-32427
- Aircraft CRT electronic displays discussing operational flexibility versus control and monitor complexities, economics, reliability and human factors A72-32632
- Digital attitude and heading reference system computer for aircraft heading control, discussing design and performance features A72-32636
- Flight test instrumentation system for measurement of aircraft performance, stability and control characteristics during nonsteady flight A72-33244
- Russian book on flight dynamics covering horizontal flight, takeoff, climb and landing characteristics, meteorological conditions, helicopters, trajectory problems, stability and controllability analysis, etc A72-33639
- Maximum likelihood parameter estimation for extracting stability and control derivatives of aircraft from flight test data using real time digital computer [NASA-TN-D-6735] A72-33874
- Development of thrust control system for application to control of aircraft and spacecraft [NASA-CASE-MSC-13397-1] N72-24625
- AIRCRAFT DESIGN**
- Suboptimal feedback control for aircraft gust alleviation design, using indirect perturbation information through normal acceleration factor measurement A72-32025
- Book on airfoil section designs for light aircraft covering wind tunnel studies of lift drag ratio as function of angle of attack A72-32250
- Aircraft design for operational reliability and maintainability, emphasizing working relations coordination between manufacturer and operator A72-32459
- Concorde on-time operation as total management problem from design to airline operations, discussing techniques for in-flight failure diagnosis and onward reporting A72-32460
- Fokker VTOL transport aircraft designs, considering payload, range, runway conditions, noise, military capabilities and operational costs A72-33048
- V/STOL weapon system VJ-101 design, discussing one axis rocking device, suspension structure and hovering flight thrust control A72-33049
- STOL aircraft for civil transport applications, considering optimum design concepts, noise reduction and terminal facility requirements A72-33331
- Design, development, and characteristics of aircraft for air bus operations [NASA-TT-P-14240] N72-24013
- AIRCRAFT ENGINES**
- Optimum low noise engine selection for transport and combat aircraft relative to range or payload performance, considering CTOL, VTOL, SST and fighter aircraft A72-32127
- Integrated data acquisition and processing system for inlet-aircraft engine matching, considering all-digital, analog and hybrid approach A72-32319
- RB 211 three-shaft turbofan engine for L-1011 airliner, describing design for noise reduction A72-32428
- Concorde engines design for maintainability and reliability to reduce turnaround time, discussing diagnostic facilities and on-wing maintenance features A72-32457
- Aero engines and propulsion systems development contribution to air transport economics and regularity, considering environmental factors A72-33313
- Commercial transport aircraft engine technology contribution to world air transportation, considering social and ecological compatibility with community A72-33314
- Russian book on aircraft turbine and spacecraft rocket engine assembly covering process schedules, work organization, precision, joints and couplings, quality control, etc A72-33373
- Rotor head, rotor blade, transmission, and Rolls Royce 360 engine studies [AD-737611] N72-25014
- Flightweight components and water cooled test adapters for hypersonic engine [NASA-CR-112055] N72-25711
- Installation of structures assembly model and wind tunnel systems [NASA-CR-112056] N72-25712
- Aerothermodynamic integration model, including combustor design, flow distribution, and heat transfer problems [NASA-CR-112058] N72-25713
- Aerothermodynamic integration model, including flow paths, leading edges, and ducts [NASA-CR-112059] N72-25714
- Purge system and components of HRE AIM [NASA-CR-112060] N72-25715
- AIRCRAFT EQUIPMENT**
- Reduced voltage relay operation in aircraft high voltage ac power systems, describing RLC circuit theory, laboratory test arrangement and performance measurements A72-31215
- Collision avoidance techniques for midair collisions reduction, discussing airborne and ground based systems A72-32213
- Electromagnetic waves penetration through conducting gasket used to protect sensitive devices in aircraft, investigating field strength variation with distance from gasket A72-32571
- Polyimide hydraulic actuator rod seals for application in high performance aircraft [NASA-CR-120878] N72-24530
- Low pass filter requirements and performance in variable speed constant frequency system for aircraft electric power supplies [RAE-TR-71088] N72-25273
- Concepts, philosophy, and development of minimum operational characteristics for airborne navigation systems [DO-149] N72-25603
- AIRCRAFT GUIDANCE**
- Fighter bomber Loran-inertial data processing with digital computer to combine navigation, guidance and weapon delivery into fully integrated system A72-33246
- Concepts, philosophy, and development of minimum operational characteristics for airborne navigation systems [DO-149] N72-25603
- Performance and problems of microwave guidance systems for aircraft approach and landing [RAE-TR-71186] N72-25606
- AIRCRAFT HAZARDS**
- Probabilistic analysis of aircraft crash-caused structural damage to nuclear power plant, using Monte Carlo method and yield line theory for perforation and collapse modes A72-33600
- Analysis of US general aviation aircraft accidents for calendar year 1969 N72-25003
- AIRCRAFT INDUSTRY**
- Aircraft industry product support role in time delays minimization for aircraft operators, discussing malfunction report, minimum equipment decision and fault diagnosis A72-32456
- Financial methods employed in creating Brazilian aircraft industry via mixed public-private ownership

AIRCRAFT INSTRUMENTS A72-33375
 DAMIEN III digital magnetic tape recording system
 for aircraft flight test data acquisition,
 discussing components

A72-33629
 Aircraft instrumentation system accuracy relation
 to aerodynamic derivatives evaluated from flight
 data, proposing input and transient response
 measurement system

A72-33640
 Summary of literature on altimeter display
 relating to aircraft height
 [FAA-RD-72-46] N72-25426

Approximate compensation in airborne magnetometry
 for changing inductive field of aircraft moving
 through varying geomagnetic field N72-25435

AIRCRAFT LANDING

Tactical approach landing radar tests for low lift
 drag ratio aircraft in unpowered flight, using
 F-104D as test aircraft A72-31694

Flight experiments to determine horizontal visual
 restriction effects on T-33 aircraft front
 cockpit during approaches and landings A72-31697

Jet lift VTOL flight path optimization for minimum
 landing transition distance, evaluating
 deceleration as function of incidence and thrust
 vector angles A72-32323

STRADA landing trajectory recording system for
 real time flight path restitution during
 approach and landing, using computer and lidar
 techniques A72-32895

Aircraft flight characteristics for landing
 approach by spoiler-elevator deflection
 coupling, considering pitch, flight path angle
 and speed A72-33423

Solid state modular ground based distance
 measuring equipment /DME/ receiver for en route
 aircraft navigation and landing A72-33521

Computerized aircraft landing measurement system
 for civil airport, using optical, seismic and IR
 sensors A72-33627

Measurement of ground loads on OV-1 aircraft
 during landings on smooth and rough fields
 [AD-737752] N72-24030

Criteria for installation of instrument landing
 systems and effects of siting on operation of
 system [DOT-FAA-6750.16] N72-24338

AIRCRAFT MAINTENANCE

Airline maintenance program and facilities for
 Boeing 747 aircraft based on optimized service
 concept A72-32430

AIRCRAFT MODELS

Experimental method for measuring heat transfer in
 hypersonic aerodynamic models [REPT-32] N72-25918

AIRCRAFT NOISE

Quiet RTOL/reduced takeoff and landing/ short
 haul aircraft cost comparison with Trident 3
 aircraft up to design range stage length A72-31320

Optimum low noise engine selection for transport
 and combat aircraft relative to range or payload
 performance, considering CTOL, VTOL, SST and
 fighter aircraft A72-32127

Low noise aircraft-engine configuration
 feasibility, discussing turbofan engine noise
 reduction A72-32322

High intensity sound effects on electronic
 equipment and components in aircraft noise
 environment, noting whisker diode and printed
 circuit board damage A72-32621

Airport vicinity aircraft noise exposure contour
 calculated from measured data at Osaka Airport
 A72-32885

Large-scale wind tunnel investigation of noise
 characteristics of semispan wing equipped with
 externally blown jet flaps [NASA-TN-X-62154] N72-24011

Acceptability of VTOL aircraft noise determined by
 test subjects evaluating simulated sounds of
 helicopter, tilt wing aircraft, and turbojet
 aircraft [NASA-CR-2043] N72-24025

Correlation of total sound power and peak sideline
 overall sound pressure level for subsonic and
 supersonic jets of aircraft engine exhaust
 [NASA-TN-X-68059] N72-24711

AIRCRAFT PERFORMANCE

Flight test instrumentation system for measurement
 of aircraft performance, stability and control
 characteristics during nonsteady flight A72-33639

Aerodynamic characteristics and operational
 capability of TU-144 aircraft [NASA-TT-P-14241] N72-24009

Flight evaluation of takeoff and landing
 characteristics of short takeoff aircraft to
 determine limiting factors on short takeoff
 operation [RAE-LIB-TRANS-1604] N72-24026

Flight test of F-8 aircraft to determine minimum
 time energy climbs based on energy state
 approximation [AD-738018] N72-24035

Bibliography of control devices to provide
 improved tactical agility for jet fighter aircraft
 [AD-737694] N72-24036

Catalog on capacity and efficiency of air traffic
 control systems [AD-737513] N72-24683

Statistical analysis of mission profiles for
 passenger- and cargo-transport aircrafts
 [TB-88] N72-25002

Improved aircraft ground performance in slush and
 wet runway conditions by addition of extra nose
 wheel [ARC-CP-1206] N72-25009

Fixed base simulator study of direct lift control
 on VC-10 aircraft [ARC-CP-1199] N72-25010

AIRCRAFT PILOTS

Illustrated biography of Wiley Post to record
 significant accomplishments in long range flight
 and aeronautical engineering N72-25952

AIRCRAFT PRODUCTION

Nondestructive tests applied to quality control of
 airframes made of boron composites N72-24936

Air safety program for aircraft manufacturers
 N72-25974

AIRCRAFT RELIABILITY

Military systems cost reduction via civil avionics
 procurement techniques, discussing
 cost-reliability design criteria A72-32215

Time parameter in military air operations,
 discussing weapon systems R and D, all-weather
 capability, communications, reliability and
 maintainability, manpower training, etc A72-32453

AIRCRAFT SAFETY

Simulator for physical forces experienced by
 carrier aircraft during catapult launches and
 arrested landings, considering external stores
 safe suspension A72-32620

SECANT collision avoidance system, describing
 operational principles and flight test results
 A72-34137

Development of computer program to analyze
 effectiveness of pilot warning indicator systems
 in avoiding aircraft collisions [NASA-CR-126669] N72-24672

Analysis of collision hazards involved in VFR
 flight near clouds and effect of safe vertical
 clearance from clouds to reduce aircraft accidents
 [AD-737804] N72-24682

Catalog on capacity and efficiency of air traffic
 control systems [AD-737513] N72-24683

Fatigue assessment of safe life and fail-safe
 structures

SUBJECT INDEX

AIRLINE OPERATIONS

- [ARL/SM-REPT-334] N72-25899
Practical application of mishap data in Army aircraft system safety programs
- N72-25967
Pilot safety considerations in design and operation of X-24A lifting body vehicle
- N72-25969
AIRCRAFT SPECIFICATIONS
Air safety program for aircraft manufacturers
- N72-25974
AIRCRAFT STABILITY
Aeroelasticity, discussing gust and maneuver load alleviation, flutter suppression, aircraft stability, computerized aeroelastic analysis, aeroelastic optimization, composite structures, etc
- A72-31202
Hydrofluidic three-axis stability augmentation system to improve OH-1B helicopter damping and handling qualities during high speed gunfiring missions
- A72-33650
Russian book on flight dynamics covering horizontal flight, takeoff, climb and landing characteristics, meteorological conditions, helicopters, trajectory problems, stability and controllability analysis, etc
- A72-33874
Effects of longitudinal acceleration and Magnus forces and moments on stability of aircraft with constant velocity around longitudinal axis [AD-738231] N72-24394
- Maximum likelihood parameter estimation for extracting stability and control derivatives of aircraft from flight test data using real time digital computer [NASA-TN-D-6735] N72-24625
- AIRCRAFT STRUCTURES**
L-1011 propulsion, fuel, flight control, navigation, avionics, communication, electrical, environmental control and auxiliary power systems, discussing structure and high lift devices
- A72-32427
Adhesive bonding of L-1011 body shell panels for improved fatigue strength and corrosion resistance
- A72-32429
Cost-saving techniques in helicopter structural test methods, suggesting system simulation, component replacement time calculation and computer techniques
- A72-33221
Resonant vibration of thin walled rods and stiffened plates and cylindrical shells, noting aircraft and rocket structures
- A72-33679
Fatigue assessment of safe life and fail-safe structures [ARL/SM-REPT-334] N72-25899
- AIRCRAFT TIRES**
Performance tests of aircraft tire under cyclic braking conditions and evaluation of aircraft antiskid braking system [NASA-TN-D-6755] N72-24014
- Prediction of lateral tire dynamic properties of scale model aircraft tires using string theory [NASA-CR-2058] N72-24024
- AIRCRAFT WAKES**
Wind tunnel test data of velocity measurements with hot wire anemometer in wake of CV-990 aircraft model [NASA-TN-X-62148] N72-23994
- AIRFOIL PROFILES**
Contracting or diverging stream flow mean velocity change effects on airfoil pressure distribution, circulation and lift, deriving vortex distribution expression
- A72-32023
Book on airfoil section designs for light aircraft covering wind tunnel studies of lift drag ratio as function of angle of attack
- A72-32250
Unsteady viscous flow effects on aerodynamic forces exerted on oscillating elliptic airfoil for various Reynolds numbers, angles of attack and frequencies
- A72-32344
Collocation method for coupled bending-bending torsion vibrations of straight uniform cantilever beam with asymmetric airfoil cross section
- A72-32908
Transonic airfoil section design to given surface pressure distribution, applying finite difference procedures to transonic small disturbance equations [AIAA PAPER 72-679] A72-34062
- AIRFOILS**
Airfoil vortex shedding noise in low-turbulence flow at helicopter blade Reynolds numbers, obtaining correlation coefficients for far field noise and surface pressure fluctuations [AIAA PAPER 72-656] A72-34078
- Development of computer program to determine aerodynamic characteristics of airfoils under conditions of zero trailing edge angle [AD-738318] N72-24003
- Numerical analysis of potential flow problem of two dimensional airfoil with distributed suction N72-24359
- Thermal, tensile, and creep rupture properties of nickel based alloys for airfoils [NASA-TN-X-68051] N72-24585
- Aerodynamic characteristics of elliptical airfoil with circulation control by tangential trailing edge blowing N72-24989
- Subsonic behavior of three annular airfoils for turbofan engine cowlings [ARC-R/M-3688] N72-24999
- AIRFRAME MATERIALS**
Thermal aspects of using filamentary composite materials for airframes on atmospheric entry spacecraft [SD-72-SH-0015] N72-25542
- AIRFRAMES**
Nondestructive tests applied to quality control of airframes made of boron composites N72-24936
- AIRLINE OPERATIONS**
Airline maintenance program and facilities for Boeing 747 aircraft based on optimized service concept
- A72-32430
Total system approach to time scheduled aircraft operations - Conference, London, May 1972
- A72-32451
Short haul airlines on-time operation, discussing ATC, weather, cargo and aircraft ground handling, cabin and flight services and aircraft reliability effects
- A72-32452
Aircraft industry product support role in time delays minimization for aircraft operators, discussing malfunction report, minimum equipment decision and fault diagnosis
- A72-32456
Concorde on-time operation as total management problem from design to airline operations, discussing techniques for in-flight failure diagnosis and onward reporting
- A72-32460
Avionics effects on airline operations timekeeping, considering gains due to all-weather capability and engine monitoring vs possible losses due to equipment failures
- A72-32461
Aircraft on-time operation and air traffic problems, considering solution requirement formulation and funding suggestions
- A72-32462
Jet aircraft gas turbine engine technology impact on safety, reliability, airline profitability and international trade
- A72-33315
Developing countries civil aviation airlines evolution, considering government fund allocation, international money credibility, skilled manpower, equipment, fare and tourism expansion
- A72-33332
Commercial airlines aircraft selection factors, considering size, range, economics, traffic, runway quality, maintenance and operating costs, reliability and cargo handling
- A72-33333
Government regulations effects on local service airlines cost performance and growth strategies

AIRPLANE PRODUCTION COSTS

SUBJECT INDEX

A72-33374
 Passenger transfer in airports with total separation between aircraft and permanent buildings for independent functioning, noting Dulles Airport mobile lounges

A72-34143
 Individual and group air carrier statistics

N72-24979
 Improved aircraft ground performance in slush and wet runway conditions by addition of extra nose wheel
 [ARC-CP-1206]

N72-25009
AIRPLANE PRODUCTION COSTS
 Military systems cost reduction via civil avionics procurement techniques, discussing cost-reliability design criteria

A72-32215
AIRPORT PLANNING
 National airports system for UK civil air transportation, discussing economic, operational, accessibility and social aspects

A72-32321
 Airport capacity and air traffic congestion effects on airport operations in terms of time and costs

A72-32454
 Dallas/Fort Worth airport planning and construction economics impact on community economy and life style

A72-33307
 Airport and air transportation benefits and costs to community and industry, considering institutional, environmental and economic issues

A72-33308
 Airport economic and social impact on environs in terms of community development

A72-33309
 Individual regions and nationwide air traffic demands forecasting for airport planning

A72-33311
 Commercial airport and air transport service economic impacts on business and industrial communities

A72-33312
 Major civil airport planning, discussing information gathering and processing for aviation demand, aircraft movements revenue and cost forecasts and pricing policy evaluation

A72-33327
 Major civil airport development plan, discussing traffic forecasts, runways, noise, airspace capacity, access systems, freight installations, maintenance facilities, navigation aids, buildings, etc

A72-33328
 Major civil airport passenger and cargo terminal complex design and layout planning, discussing various facilities and equipment requirements

A72-33329
 FAA policy in issuing civil airport operating certificates and establishing minimum safety standards

A72-33330
 Passenger transfer in airports with total separation between aircraft and permanent buildings for independent functioning, noting Dulles Airport mobile lounges

A72-34143
 Budget management for modernization and expansion of airports

N72-24337
 Noise exposure forecasts for airport vicinity in land use management
 [ISAS-476-VOL-37-NO-2]

N72-24344
 FAA Airport and Airway System unit cost estimates and allocation study

N72-24982
 Capital cost analysis of airport alternatives for San Francisco Bay area for general aviation and commercial aircraft

N72-24985
 Airport planning in West Germany discussing surface transport facilities and pollution
 [DGLR-PAPER-71-075]

N72-24986
AIRPORTS
 Airport vicinity aircraft noise exposure contour calculated from measured data at Osaka Airport

A72-32885

Airport systems and grant programs under Airport and Airway Development Act of 1970
 [AD-737040]

N72-24352
 Air pollution for peak traffic periods at Heathrow Airport, London, for April through September for 1970

N72-24649
AIRSPACE
 ATC system organization in terms of optimal operating conditions for civil and military airspace users, discussing navigation systems, human factors, equipment reliability, etc

A72-32455
ALL-WEATHER AIR NAVIGATION
 Time parameter in military air operations, discussing weapon systems R and D, all-weather capability, communications, reliability and maintainability, manpower training, etc

A72-32453
 Avionics effects on airline operations timekeeping, considering gains due to all-weather capability and engine monitoring vs possible losses due to equipment failures

A72-32461
ALTIMETERS
 Summary of literature on altimeter display relating to aircraft height
 [FAA-RD-72-46]

N72-25426
ANALOG SIMULATION
 Analog simulation method for highly redundant structure optimization based on reproducing structure mechanical behavior in stabilized stress states

A72-32899
ANALOG TO DIGITAL CONVERTERS
 Airborne flight test data acquisition system modular design to provide digital readings from monitoring transducers analog signal

A72-33645
ANGLE OF ATTACK
 Leading edge boundary layer flow separation and reattachment processes in airfoil dynamic stall, considering effect of angle of attack rate of change

A72-32024
 Book on airfoil section designs for light aircraft covering wind tunnel studies of lift drag ratio as function of angle of attack

A72-32250
 Unsteady viscous flow effects on aerodynamic forces exerted on oscillating elliptic airfoil for various Reynolds numbers, angles of attack and frequencies

A72-32344
ANTISKID DEVICES
 Performance tests of aircraft tire under cyclic braking conditions and evaluation of aircraft antiskid braking system
 [NASA-TN-D-6755]

N72-24014
ANTISUBMARINE WARFARE
 Univac 1832 multiprocessor avionics computer for airborne ASW, discussing input/output controllers and interfaces and IC design features

A72-33245
APPROACH CONTROL
 Tactical approach landing radar tests for low lift drag ratio aircraft in unpowered flight, using F-104D as test aircraft

A72-31694
 Hybrid area navigation and microwave instrument landing system, discussing approach control and terminal guidance

A72-32206
 Flight tests to determine effects of various approach angles on performance of executive transport jet aircraft
 [FAA-PS-600-7]

N72-24022
 Criteria for installation of instrument landing systems and effects of siting on operation of system
 [DOT-FAA-6750.16]

N72-24338
 Performance and problems of microwave guidance systems for aircraft approach and landing
 [RAE-TR-71186]

N72-25606
ARCTIC REGIONS
 Arctic environment surface effect vehicle design, considering structures, drag, lift, propulsive power and range

A72-32125

SUBJECT INDEX

BIBLIOGRAPHIES

ARMED FORCES

Laws governing military use of civil aircraft
N72-25960

ARMED FORCES (UNITED STATES)

USAF Academy air navigation training program,
discussing systems development course and
descriptive and applied astronomy
A72-32210

Practical application of mishap data in Army
aircraft system safety programs
N72-25967

ASCENT TRAJECTORIES

Singular optimal control and minimum time of
ascent for supersonic aircraft
N72-24006

ASTRONAUTICS

Aviation and astronautics - Conference, Tel
Aviv-Haifa, March 1972
A72-31201

ATMOSPHERIC CHEMISTRY

Bibliography on SST upper atmospheric environment,
listing references to stratospheric structure,
composition and physical dynamics, chemical
reactions with pollutants, transport properties,
etc
A72-33797

ATMOSPHERIC CIRCULATION

Climatic changes due to stratospheric perturbation
by propulsion effluents of high altitude
aircraft flights
[AIAA PAPER 72-658]
A72-34076

ATMOSPHERIC DIFFUSION

SST contrails stratospheric dispersion by aircraft
wake, atmospheric turbulence and exhaust gases
temperature induced buoyancy
[AIAA PAPER 72-650]
A72-34084

ATMOSPHERIC PHYSICS

Bibliography on SST upper atmospheric environment,
listing references to stratospheric structure,
composition and physical dynamics, chemical
reactions with pollutants, transport properties,
etc
A72-33797

ATS 6

Performance tests of L band communication concepts
for air traffic control equipment installed in
Applications Technology Satellite-F
[NASA-TN-X-65906]
N72-25601

ATTACK AIRCRAFT

Electronic displays with weapon aiming sensors in
aircraft navigator-attack systems
A72-32634

ATTITUDE CONTROL

Digital attitude and heading reference system
computer for aircraft heading control,
discussing design and performance features
A72-33244

Development and characteristics of system for
providing short term attitude holding and
stabilization of helicopters
[AD-737707]
N72-24031

ATTITUDE STABILITY

Development and characteristics of system for
providing short term attitude holding and
stabilization of helicopters
[AD-737707]
N72-24031

AUTOMATIC CONTROL

Monitor and regulator for automatic speed control
and flow velocity measurement in wind tunnel
A72-33609

AUTOMATIC FLIGHT CONTROL

Autoland system flight testing in Trident 3B and
British Civil Aviation Authority approval for
ICAO Cat 3a weather
A72-33539

AUTOMATIC LANDING CONTROL

Statistical correlation techniques applied to jet
aircraft autoland system dynamic ground tests
with simulated engine and aerodynamic
characteristics
A72-33641

AUXILIARY POWER SOURCES

Reduced voltage relay operation in aircraft high
voltage ac power systems, describing RLC circuit
theory, laboratory test arrangement and
performance measurements
A72-31215

AVIONICS

Avionics equipment for signal processing onboard

civil aircraft to improve flight safety,
discussing uses of OMEGA navigation system and
digital computers
A72-31178

Error analysis for digital avionics system
involving Doppler navigation by intermittent
scanning of single beam multimode radar, noting
optimum statistical data processing
A72-32204

Military systems cost reduction via civil avionics
procurement techniques, discussing
cost-reliability design criteria
A72-32215

Avionics effects on airline operations
timekeeping, considering gains due to
all-weather capability and engine monitoring vs
possible losses due to equipment failures
A72-32461

Aircraft electronic display for pilot precise
control in complex tasks, discussing clarity,
stability and readability of CRT images
A72-32632

Civil helicopter electronic display requirements
contrasted with fixed wing aircraft
A72-32633

Electronic displays with weapon aiming sensors in
aircraft navigator-attack systems
A72-32634

Electronic display in future avionic systems,
emphasizing computer techniques and digital data
exchange systems
A72-32635

Aircraft CRT electronic displays discussing
operational flexibility versus control and
monitor complexities, economics, reliability and
human factors
A72-32636

Univac 1832 multiprocessor avionics computer for
airborne ASW, discussing input/output
controllers and interfaces and IC design features
A72-33245

Flight training simulator criteria and design
considerations, noting avionics, model aircraft,
control console and teaching aspects
A72-33501

Integrated airborne-ground based instrumentation
system for variable stability X-22A aircraft
flying qualities research, discussing telemetry,
mobile van, landing aids and airplane design
A72-33628

Avionics research on navigation, identification,
and landing systems
[AD-738178]
N72-24193

AXISYMMETRIC FLOW

Turbulent flow between rotating disk and turbine
engine body calculated from equations of
axisymmetric viscous incompressible fluid flow
A72-31702

Axisymmetric jet impact on ground board for
different nozzle configurations and heights in
VTOL aircraft aerodynamic studies
A72-33404

B

B-70 AIRCRAFT

Static pressure position error calibrations for
compensated and uncompensated XB-70 nose boom
pitot static tube
[NASA-TN-D-6827]
N72-24016

BEAMS (RADIATION)

Low cost microwave scanning beam landing systems
for interim instrument landing system
replacement in civil aviation
A72-32217

BENDING VIBRATION

Collocation method for coupled bending-bending
torsion vibrations of straight uniform
cantilever beam with asymmetric airfoil cross
section
A72-32908

BIBLIOGRAPHIES

Bibliography on SST upper atmospheric environment,
listing references to stratospheric structure,
composition and physical dynamics, chemical
reactions with pollutants, transport properties,
etc
A72-33797

BIOGRAPHY

Bibliography of control devices to provide improved tactical ability for jet fighter aircraft
[AD-737694] N72-24036

BIOGRAPHY

Illustrated biography of Wiley Post to record significant accomplishments in long range flight and aeronautical engineering

N72-25952

BLAST DEFLECTORS

Scale model tests of high thrust engine blast deflection fence combinations for protection of adjacent roadway traffic

A72-33698

BLOWDOWN WIND TUNNELS

Blowdown wind tunnel internal and external noise fields prediction by empirical method, considering valves, burners, turbulent boundary layers and exhaust jets as sources
[AIAA PAPER 72-668]

A72-34070

BLUNT BODIES

Sonic boom induced flow field at supersonic/hypersonic speeds, using shock expansion method and hypersonic equivalence principle for sharp and blunt nosed bodies
[AIAA PAPER 72-652]

A72-34082

BOEING 747 AIRCRAFT

Airline maintenance program and facilities for Boeing 747 aircraft based on optimized service concept

A72-32430

Meteorological data analysis for CAT encounter of Boeing 747 flight over Nantucket Island on 4 November 1970

A72-33525

BOOSTER RECOVERY

Booster launch vehicle guidance scheme for critical aborts from staging through burnout, minimizing aerodynamic phases for different landing sites

A72-32182

BOUNDARY LAYER SEPARATION

Leading edge boundary layer flow separation and reattachment processes in airfoil dynamic stall, considering effect of angle of attack rate of change

A72-32024

Three dimensional boundary layer separation on slender bodies, delta wings and propulsion intake systems, reviewing computing techniques for interfering inviscid flow fields

A72-32826

BOUNDARY LAYERS

Aerodynamic stall characteristic prediction from static experimental data for airfoils, noting boundary layer effects
[AIAA PAPER 72-682]

A72-34060

BOUNDARY VALUE PROBLEMS

Aerodynamic properties prediction procedure for thin jet-flapped airfoil in incompressible inviscid flow bounded by different types of boundaries

A72-32147

BUOYANCY

Buoyancy systems and parawings application in short haul passenger transportation, discussing VTOL and STOL operations

A72-33183

C

C-130 AIRCRAFT

Flight tests of EC-130E aircraft with X band radome installed
[ENEA-71-45]

N72-25007

CABIN ATMOSPHERES

Electromechanical device for recording infrared gaseous oxygen spectra in pressurized aircraft cabin atmosphere
[CL-1971-16]

N72-24498

CANARD CONFIGURATIONS

Vortex sheet simulation method for slender wing-canard surface nonlinear interaction investigation

A72-33695

CANTILEVER BEAMS

Collocation method for coupled bending-bending torsion vibrations of straight uniform cantilever beam with asymmetric airfoil cross section

SUBJECT INDEX

A72-32908

CARGO

Prediction models for dynamic environment experienced by cargo during air and rail transportation

A72-32610

CARGO AIRCRAFT

Dynamic input to cargo in turbojet aircraft studied during C141 and C5A flights, discussing instrumentation, test procedures, data reduction processes and results

A72-32625

CASCADE FLOW

Velocity profiles for three dimensional turbulent boundary layer on end wall of axial flow compressor cascade passage under adverse pressure gradients

A72-32901

CATALOGS (PUBLICATIONS)

Catalog on capacity and efficiency of air traffic control systems
[AD-737513]

N72-24683

CATAPULTS

Simulator for physical forces experienced by carrier aircraft during catapult launches and arrested landings, considering external stores safe suspension

A72-32620

CATHODE RAY TUBES

Aircraft CRT electronic displays discussing operational flexibility versus control and monitor complexities, economics, reliability and human factors

A72-32636

CENTRIFUGAL FORCE

Nonlinear analysis of helicopter rotor blade free transverse vibration under air and centrifugal loadings during forward flight, using matrix method

A72-31407

CENTRIFUGAL PUMPS

Method for evaluating liquid pump operational and functional performance characteristics
[AD-737713]

N72-24541

CERTIFICATION

FAA policy in issuing civil airport operating certificates and establishing minimum safety standards

A72-33330

Autoland system flight testing in Trident 3B and British Civil Aviation Authority approval for ICAO Cat 3a weather

A72-33539

CH-47 HELICOPTER

Design, development, and evaluation of glass-reinforced epoxy rotor blades on CH-47 helicopter
[AD-738203]

N72-24033

CH-54 HELICOPTER

S-64 Skycrane helicopter current and anticipated applications in commerce and industry, considering logging operations in ecologically sensitive or rugged areas, bridge construction, etc

A72-33185

CHECKOUT

Checkout of multipoint sampling rake and exhaust emission of turbofan engines
[PB-207321]

N72-25593

CHEMICAL PROPERTIES

Chemical and structural properties of urethane elastomers and resistance to rain erosion
[AD-737624]

N72-24618

CIVIL AVIATION

Avionics equipment for signal processing onboard civil aircraft to improve flight safety, discussing uses of OMEGA navigation system and digital computers

A72-31178

Low cost microwave scanning beam landing systems for interim instrument landing system replacement in civil aviation

A72-32217

National airports system for UK civil air transportation, discussing economic, operational, accessibility and social aspects

A72-32321

ATC system organization in terms of optimal operating conditions for civil and military

SUBJECT INDEX

COMPOSITE MATERIALS

- airspace users, discussing navigation systems, human factors, equipment reliability, etc
A72-32455
- Management information system role in cost effective civil and military aircraft operations, discussing hardware modification and human resources and communication system adaptation
A72-32458
- Air cushion landing system application for civil air transportation, discussing operation, braking and parking
A72-33184
- Commercial airport and air transport service economic impacts on business and industrial communities
A72-33312
- Civil aviation safety - Conference, Beirut, Lebanon, November-December 1971
A72-33326
- Major civil airport planning, discussing information gathering and processing for aviation demand, aircraft movements revenue and cost forecasts and pricing policy evaluation
A72-33327
- Major civil airport passenger and cargo terminal complex design and layout planning, discussing various facilities and equipment requirements
A72-33329
- FAA policy in issuing civil airport operating certificates and establishing minimum safety standards
A72-33330
- STOL aircraft for civil transport applications, considering optimum design concepts, noise reduction and terminal facility requirements
A72-33331
- Developing countries civil aviation airlines evolution, considering government fund allocation, international money credibility, skilled manpower, equipment, fare and tourism expansion
A72-33332
- Commercial airlines aircraft selection factors, considering size, range, economics, traffic, runway quality, maintenance and operating costs, reliability and cargo handling
A72-33333
- Forecasts of aviation activity for fiscal years 1972 to 1973 to indicate expected status of commercial and general aviation
[AD-738360] N72-24034
- Senate report on transportation of Government civil and military passengers and cargo by civil and military air carriers
[S-REPT-92-503] N72-25948
- FAA national policies on overall missions and criteria for major subsystems
[REPT-1000.27-APP-1] N72-25949
- Laws governing military use of civil aircraft
N72-25960
- CLEANERS**
Surface properties and soil retention of aircraft painted with polyurethane paint, and requirements for aircraft cleaner
[AD-736971] N72-24613
- CLEAR AIR TURBULENCE**
Meteorological data analysis for CAT encounter of Boeing 747 flight over Nantucket Island on 4 November 1970
A72-33525
- CLIMATOLOGY**
Climatic changes due to stratospheric perturbation by propulsion effluents of high altitude aircraft flights
[AIAA PAPER 72-658] A72-34076
- CLIMBING FLIGHT**
STOL aircraft minimum noise takeoff trajectories determination, taking into account engine thrust and listeners distance from noise source
[AIAA PAPER 72-665] A72-34072
- Flight test of F-8 aircraft to determine minimum time energy climbs based on energy state approximation
[AD-738018] N72-24035
- CLOCKS**
Time/frequency technology application to reliable aircraft collision avoidance system, discussing precision time-ordered techniques, frequency control and synchronization and flying clocks
A72-32072
- CLOUD SEEDING**
Airport runway fog dispersal in UK, discussing cost projection for chemical seeding system combined with lidar remote sensing
A72-33500
- COCKPITS**
Flight experiments to determine horizontal visual restriction effects on T-33 aircraft front cockpit during approaches and landings
A72-31697
- Development of standardized method for evaluating physical geometry of aircrew stations - Vol. 1
[AD-738006] N72-25015
- COLLISION AVOIDANCE**
Time/frequency technology application to reliable aircraft collision avoidance system, discussing precision time-ordered techniques, frequency control and synchronization and flying clocks
A72-32072
- Collision avoidance techniques for midair collisions reduction, discussing airborne and ground based systems
A72-32213
- SECANT collision avoidance system, describing operational principles and flight test results
A72-34137
- Development of computer program to analyze effectiveness of pilot warning indicator systems in avoiding aircraft collisions
[NASA-CR-126669] N72-24672
- Analysis of collision hazards involved in VFR flight near clouds and effect of safe vertical clearance from clouds to reduce aircraft accidents
[AD-737804] N72-24682
- COLLOCATION**
Collocation method for coupled bending-bending torsion vibrations of straight uniform cantilever beam with asymmetric airfoil cross section
A72-32908
- COMBUSTION**
Rotating flow introduction effects on jet noise levels, combustion and turbulent mixing processes and flame stability
[AIAA PAPER 72-645] A72-34087
- COMBUSTION CHAMBERS**
Aerothermodynamic integration model, including combustor design, flow distribution, and heat transfer problems
[NASA-CR-112058] N72-25713
- COMBUSTION PRODUCTS**
Analysis of sources, constituents, and influence of operating conditions on emission characteristics of jet engine exhaust
[NASA-TM-X-68064] N72-24830
- COMMERCIAL AIRCRAFT**
Commercial airlines aircraft selection factors, considering size, range, economics, traffic, runway quality, maintenance and operating costs, reliability and cargo handling
A72-33333
- Forecasts of aviation activity for fiscal years 1972 to 1973 to indicate expected status of commercial and general aviation
[AD-738360] N72-24034
- Capital cost analysis of airport alternatives for San Francisco Bay area for general aviation and commercial aircraft
N72-24985
- COMMUNICATION SATELLITES**
Aeronautical communication satellite technical and economic survey, considering wave propagation, noise, aircraft antennas and VHF and UHF links
A72-31180
- Technical and operational aspects of L-band satellite system for air navigation, discussing verbal communication, direction finding and noise interference problems
A72-34138
- COMPONENT RELIABILITY**
Flightweight components and water cooled test adapters for hypersonic engine
[NASA-CR-112055] N72-25711
- COMPOSITE MATERIALS**
End oriented, fiber reinforced plastic composites as rain erosion resistant materials
[AD-738079] N72-24616

COMPOSITE STRUCTURES

SUBJECT INDEX

- Thermal aspects of using filamentary composite materials for airframes on atmospheric entry spacecraft
[SD-72-SH-0015] N72-25542
- COMPOSITE STRUCTURES**
- Nondestructive test for failure inspection and quality control of composite structures and materials - conference
[AGARD-R-590] N72-24934
- Nondestructive tests applied to quality control of airframes made of boron composites
N72-24936
- COMPUTER DESIGN**
- Digital attitude and heading reference system computer for aircraft heading control, discussing design and performance features
A72-33244
- Univac 1832 multiprocessor avionics computer for airborne ASW, discussing input/output controllers and interfaces and IC design features
A72-33245
- COMPUTER GRAPHICS**
- Development of air traffic control procedure using inertial navigation position reports as input data for computer graphics presentation
[FAA-RD-71-92] N72-24673
- COMPUTER PROGRAMS**
- Development of computer program to determine aerodynamic characteristics of airfoils under conditions of zero trailing edge angle
[AD-738318] N72-24003
- Development of computer program to analyze effectiveness of pilot warning indicator systems in avoiding aircraft collisions
[NASA-CR-126669] N72-24672
- Development and application of computer program for predicting unsteady loads caused by trailing edge control surface motions at subsonic speed
[NASA-CR-2003] N72-24992
- Applications of computers for flight test and evaluation of helicopters based on frequency analyses of load curves on main and tail rotors
[NASA-TT-P-14283] N72-24993
- Computer program for predicting performance, noise, weight, and cost of general aviation aircraft propellers for 1980 time period
[NASA-CR-2066] N72-25005
- Computer programs for improved methods for evaluating physical compatibility of crew members with crew stations - Vol. 3
[AD-738007] N72-25016
- COMPUTER TECHNIQUES**
- Head-up display for aircraft three dimensional sky path observation during navigation and landing, discussing computer units, CRT and image generating subsystems
A72-32042
- Electronic display in future avionic systems, emphasizing computer techniques and digital data exchange systems
A72-32635
- Computerized aircraft landing measurement system for civil airport, using optical, seismic and IR sensors
A72-33627
- COMPUTERIZED SIMULATION**
- Aeroelasticity, discussing gust and maneuver load alleviation, flutter suppression, aircraft stability, computerized aeroelastic analysis, aeroelastic optimization, composite structures, etc
A72-31202
- ATC systems fast-time simulation, emphasizing importance of human operator performance realistic modeling
A72-32097
- Computerized navigator training simulator for complete array of air navigation instruments, discussing design and human factors
A72-32208
- CONCORDE AIRCRAFT**
- Concorde engines design for maintainability and reliability to reduce turnaround time, discussing diagnostic facilities and on-wing maintenance features
A72-32457
- Concorde on-time operation as total management problem from design to airline operations, discussing techniques for in-flight failure diagnosis and onward reporting
A72-32460
- CONDUCTIVE HEAT TRANSFER**
- Experimental method for measuring heat transfer in hypersonic aerodynamic models
[REPT-32] N72-25918
- CONFERENCES**
- Aviation and astronautics - Conference, Tel Aviv-Haifa, March 1972
A72-31201
- Navigation for general aviation and navigation training - Conference, Atlanta, February-March 1972
A72-32201
- Total system approach to time scheduled aircraft operations - Conference, London, May 1972
A72-32451
- Electronic displays - Conference, London, February 1972
A72-32631
- Transportation - Conference, Washington, D.C., May-June 1972
A72-33180
- Air transportation - SAE/AIAA/ASME Conference, Washington, D.C., May-June 1972
A72-33306
- Civil aviation safety - Conference, Beirut, Lebanon, November-December 1971
A72-33326
- Nondestructive test for failure inspection and quality control of composite structures and materials - conference
[AGARD-R-590] N72-24934
- Proceedings of conference on applications of laser technology for aerodynamic measurements
[AGARD-LS-49] N72-25493
- Papers presented at conference on system safety in government and industry
[NASA-TM-X-68369] N72-25961
- CONGRESS**
- Congressional hearings concerning aeronautical research
N72-25945
- Senate report on transportation of Government civil and military passengers and cargo by civil and military air carriers
[S-REPT-92-503] N72-25948
- Laws governing military use of civil aircraft
N72-25960
- CONSTRUCTION**
- S-64 Skycrane helicopter current and anticipated applications in commerce and industry, considering logging operations in ecologically sensitive or rugged areas, bridge construction, etc
A72-33185
- CONTAINERS**
- Air cargo intermodal and interline containers handling in warehouse storage, transportation and distribution, considering total pack and interlock requirements
A72-33174
- CONTRAILS**
- SST contrails stratospheric dispersion by aircraft wake, atmospheric turbulence and exhaust gases temperature induced buoyancy
[AIAA PAPER 72-650] A72-34084
- CONTROL SIMULATION**
- Evaluation cockpit and control by variable stability system in total in-flight simulator
[AD-738314] N72-24357
- CONTROL SURFACES**
- Kernel function solution for pressure distribution over wing with oscillating control surfaces in subsonic flow
[NLR-TR-70123-U] N72-24368
- Development and application of computer program for predicting unsteady loads caused by trailing edge control surface motions at subsonic speed
[NASA-CR-2003] N72-24992
- COOLING SYSTEMS**
- Development and evaluation of cooling systems and materials for controlling structural temperature of turbine engines
[REPT-21-C-71F] N72-24822
- CORROSION RESISTANCE**
- Adhesive bonding of L-1011 body shell panels for improved fatigue strength and corrosion resistance
A72-32429

COST ANALYSIS

Capital cost analysis of airport alternatives for San Francisco Bay area for general aviation and commercial aircraft

N72-24985

COST EFFECTIVENESS

Management information system role in cost effective civil and military aircraft operations, discussing hardware modification and human resources and communication system adaptation

A72-32458

Major civil airport planning, discussing information gathering and processing for aviation demand, aircraft movements revenue and cost forecasts and pricing policy evaluation

A72-33327

Government regulations effects on local service airlines cost performance and growth strategies

A72-33374

COST ESTIMATES

FAA Airport and Airway System unit cost estimates and allocation study

N72-24982

COST REDUCTION

Military systems cost reduction via civil avionics procurement techniques, discussing cost-reliability design criteria

A72-32215

Cost-saving techniques in helicopter structural test methods, suggesting system simulation, component replacement time calculation and computer techniques

A72-33221

COWLINGS

Subsonic behavior of three annular airfoils for turbofan engine cowlings

[ARC-R/M-3688]

N72-24999

CRACKING (FRACTURING)

Fracture mechanics and crack behavior of steel plate and forging materials for aircraft

[AD-737779]

N72-24601

CRASHES

Worldwide distress alarm, identification and position location system for downed aircraft, discussing GRAN feasibility tests

A72-32214

CREEP RUPTURE STRENGTH

Thermal, tensile, and creep rupture properties of nickel based alloys for airfoils

[NASA-TM-X-68051]

N72-24585

CV-990 AIRCRAFT

Wind tunnel test data of velocity measurements with hot wire anemometer in wake of CV-990 aircraft model

[NASA-TM-X-62148]

N72-23994

CYLINDRICAL SHELLS

Resonant vibration of thin walled rods and stiffened plates and cylindrical shells, noting aircraft and rocket structures

A72-33679

D**DATA ACQUISITION**

Integrated data acquisition and processing system for inlet-aircraft engine matching, considering all-digital, analog and hybrid approach

A72-32319

Digital recording techniques for airborne data acquisition, emphasizing laser beam holographic recorders

A72-33642

Serial PCM system for flight test data acquisition and reduction compared with Harrier system

A72-33644

Airborne flight test data acquisition system modular design to provide digital readings from monitoring transducers analog signal

A72-33645

DATA CORRELATION

Data correlation of jet noise total sound power and peak sideline overall sound pressure level for subsonic and supersonic convergent exhaust nozzles

[AIAA PAPER 72-643]

A72-34089

DATA LINKS

Electronic display in future avionic systems, emphasizing computer techniques and digital data

exchange systems

A72-32635

DATA PROCESSING

Integrated data acquisition and processing system for inlet-aircraft engine matching, considering all-digital, analog and hybrid approach

A72-32319

DATA PROCESSING EQUIPMENT

Analysis of techniques and computer programs for extracting stability derivative information from flight test records

[NASA-CR-2016]

N72-24991

Applications of computers for flight test and evaluation of helicopters based on frequency analyses of load curves on main and tail rotors

[NASA-TT-F-14283]

N72-24993

DATA RECORDING

Digital recording techniques for airborne data acquisition, emphasizing laser beam holographic recorders

A72-33642

DATA SYSTEMS

Development and characteristics of support system and data reduction capability for free flight test facility

[ISAS-477-VOL-37-WO-3]

N72-24343

Practical application of mishap data in Army aircraft system safety programs

N72-25967

DC 9 AIRCRAFT

Aircraft accident involving DC-9 charter flight on instrument landing approach to Huntington, West Virginia airport on 14 November, 1970

[NTSB-AAR-72-11]

N72-25006

Aircraft accident report concerning DC-9 aircraft contact with ocean surface and subsequent emergency landing at Martha's Vineyard, Massachusetts, June 22, 1971

[PB-207101]

N72-25013

DELTA WINGS

Three dimensional boundary layer separation on slender bodies, delta wings and propulsion intake systems, reviewing computing techniques for interfering inviscid flow fields

A72-32826

Analytical method of characteristics to determine front shock and sonic boom due to flat delta wing with supersonic leading edges

A72-33401

DE 121 AIRCRAFT

Quiet RTOL /reduced takeoff and landing/ short haul aircraft cost comparison with Trident 3 aircraft up to design range stage length

A72-31320

DIGITAL COMPUTERS

Aircraft inertial navigation system, discussing mode selection unit, digital computer and control display for operator communication with system

A72-31596

Digital attitude and heading reference system computer for aircraft heading control, discussing design and performance features

A72-33244

DIGITAL NAVIGATION

Error analysis for digital avionics system involving Doppler navigation by intermittent scanning of single beam multimode radar, noting optimum statistical data processing

A72-32204

DIGITAL SIMULATION

ATC procedures training by digital radar simulators, taking into account geographic terrain, radar, wind and aircraft characteristics and flight plans

A72-32098

DIGITAL SYSTEMS

Electronic display in future avionic systems, emphasizing computer techniques and digital data exchange systems

A72-32635

DIGITAL TECHNIQUES

DAMIEN III digital magnetic tape recording system for aircraft flight test data acquisition, discussing components

A72-33629

Digital recording techniques for airborne data acquisition, emphasizing laser beam holographic recorders

DIRECT LIFT CONTROLS

SUBJECT INDEX

DIRECT LIFT CONTROLS A72-33642
Fixed base simulator study of direct lift control on VC-10 aircraft [ARC-CP-1199] N72-25010

DIRT
Surface properties and soil retention of aircraft painted with polyurethane paint, and requirements for aircraft cleaner [AD-736971] N72-24613

DISPLAY DEVICES
Aircraft inertial navigation system, discussing mode selection unit, digital computer and control display for operator communication with system A72-31596
Head-up display for aircraft three dimensional sky path observation during navigation and landing, discussing computer units, CRT and image generating subsystems A72-32042
Electronic displays - Conference, London, February 1972 A72-32631
Aircraft electronic display for pilot precise control in complex tasks, discussing clarity, stability and readability of CRT images A72-32632
Civil helicopter electronic display requirements contrasted with fixed wing aircraft A72-32633
Electronic displays with weapon aiming sensors in aircraft navigator-attack systems A72-32634
Electronic display in future avionics systems, emphasizing computer techniques and digital data exchange systems A72-32635
Aircraft CRT electronic displays discussing operational flexibility versus control and monitor complexities, economics, reliability and human factors A72-32636

DISTANCE MEASURING EQUIPMENT
Solid state modular ground based distance measuring equipment /DME/ receiver for en route aircraft navigation and landing A72-33521
Integrated inertial-VOR-DME or inertial-TACAN navigation system, presenting slant range and bearing adjustment procedure via least squares method A72-34136
Requirements for channel splitting to accommodate increased VHF omnirange navigation instrument landing systems, and distance measuring equipment facilities [PAPER-54-71/SC122-3] N72-25602

DOPPLER EFFECT
Laser Doppler velocimetry system design for optical measurement of intrablade flow velocity in turbomachinery A72-32045
Development and characteristics of dual scatter laser Doppler velocimeter for flow distribution measurement in wind tunnels, helicopter downwash, and across high lift wing sections N72-25506

DOPPLER NAVIGATION
Doppler navigation system suitability for area navigation, discussing routes versatility, accuracy and continuous velocity vector sensor A72-32203
Error analysis for digital avionics system involving Doppler navigation by intermittent scanning of single beam multimode radar, noting optimum statistical data processing A72-32204

DOWNTIME
Concorde engines design for maintainability and reliability to reduce turnaround time, discussing diagnostic facilities and on-wing maintenance features A72-32457

DUCTED FANS
Performance tests of fan stages operating with oblique weak shocks in rotor blade tip region and analysis of damage in leading edge tip region [NASA-TM-X-68027] N72-24813

DUCTED FLOW
Pressure, shear stress and yaw angle measurements in flow through aircraft intake S-shaped ducts with turbulent boundary layer at entry, noting vortex generation A72-33403

DURABILITY
Fatigue strength and durability of gas turbine vane models under isothermal and temperature changing conditions N72-24826

DYNAMIC CHARACTERISTICS
Prediction of lateral tire dynamic properties of scale model aircraft tires using string theory [NASA-CR-2058] N72-24024

DYNAMIC LOADS
Dynamic input to cargo in turbojet aircraft studied during C141 and C5A flights, discussing instrumentation, test procedures, data reduction processes and results A72-32625

DYNAMIC MODELS
Prediction models for dynamic environment experienced by cargo during air and rail transportation A72-32610

DYNAMIC STRUCTURAL ANALYSIS
Resonant vibration of thin walled rods and stiffened plates and cylindrical shells, noting aircraft and rocket structures A72-33679

DYNAMIC TESTS
Statistical correlation techniques applied to jet aircraft autoland system dynamic ground tests with simulated engine and aerodynamic characteristics A72-33641

E

ECOLOGY
Commercial transport aircraft engine technology contribution to world air transportation, considering social and ecological compatibility with community A72-33314

ECONOMIC FACTORS
Quiet RTOL /reduced takeoff and landing/ short haul aircraft cost comparison with Trident 3 aircraft up to design range stage length A72-31320
Low cost flight simulator for general aviation pilot training, containing IPB instrumentation and turbulence injection device A72-32211
Airport capacity and air traffic congestion effects on airport operations in terms of time and costs A72-32454
VTOL short haul transportation applications discussing concept evolution and economic factors A72-33181
Dallas/Port Worth airport planning and construction economics impact on community economy and life style A72-33307
Airport and air transportation benefits and costs to community and industry, considering institutional, environmental and economic issues A72-33308
Airport economic and social impact on environs in terms of community development A72-33309
Short haul air transportation system economic and political problems, noting community acceptance and passenger service standards A72-33310
Commercial airport and air transport service economic impacts on business and industrial communities A72-33312
Aero engines and propulsion systems development contribution to air transport economics and regularity, considering environmental factors A72-33313

ECONOMICS
Aeronautical communication satellite technical and economic survey, considering wave propagation, noise, aircraft antennas and VHF and UHF links

- A72-31180
Commercial airlines aircraft selection factors, considering size, range, economics, traffic, runway quality, maintenance and operating costs, reliability and cargo handling
- A72-33333
ELASTIC BENDING
Bending and torsional mode deformations of two dimensional elastic wing under sinusoidal and random gust
- A72-33229
ELASTIC DEFORMATION
Hingeless elastic helicopter blades coupled flap-lag motion under quasi-steady aerodynamic loads, reducing equations of motion to coupled nonlinear differential equations
- A72-31211
ELASTIC WAVES
Sonic boom induced pressure wave propagation and attenuation in water, comparing ballistic range measurements with theoretical predictions [AIAA PAPER 72-654] A72-34080
- ELASTOPLASTICITY**
Temperature dependent elastoplastic wing assemblies and continua analysis via matrix displacement method A72-33791
- ELECTRIC RELAYS**
Reduced voltage relay operation in aircraft high voltage ac power systems, describing RLC circuit theory, laboratory test arrangement and performance measurements A72-31215
- ELECTRICAL FAULTS**
High intensity sound effects on electronic equipment and components in aircraft noise environment, noting whisker diode and printed circuit board damage A72-32621
- ELECTROMAGNETIC NOISE**
Aeronautical communication satellite technical and economic survey, considering wave propagation, noise, aircraft antennas and VHF and UHF links A72-31180
- ELECTROMAGNETIC WAVE TRANSMISSION**
Electromagnetic waves penetration through conducting gasket used to protect sensitive devices in aircraft, investigating field strength variation with distance from gasket A72-32571
- ELECTROMECHANICAL DEVICES**
Electromechanical device for recording infrared gaseous oxygen spectra in pressurized aircraft cabin atmosphere [CL-1971-16] N72-24498
- ELECTRONIC EQUIPMENT**
High intensity sound effects on electronic equipment and components in aircraft noise environment, noting whisker diode and printed circuit board damage A72-32621
- Electronic displays - Conference, London, February 1972 A72-32631
- Performance tests of acoustic radar equipment to detect vortices formed by low flying aircraft and comparison with conventional sensing methods [FAA-RD-71-103] N72-25008
- ELECTRONIC MODULES**
Airborne flight test data acquisition system modular design to provide digital readings from monitoring transducers analog signal A72-33645
- ELEVATORS (CONTROL SURFACES)**
Aircraft flight characteristics for landing approach by spoiler-elevator deflection coupling, considering pitch, flight path angle and speed A72-33423
- ENGINE DESIGN**
Stage removal and addition effect on multistage axial compressor for application in engine design A72-31706
- Integrated data acquisition and processing system for inlet-aircraft engine matching, considering all-digital, analog and hybrid approach A72-32319
- RB 211 three-shaft turbofan engine for L-1011 airliner, describing design for noise reduction
- A72-32428
Concorde engines design for maintainability and reliability to reduce turnaround time, discussing diagnostic facilities and on-wing maintenance features
- A72-32457
Commercial transport aircraft engine technology contribution to world air transportation, considering social and ecological compatibility with community
- A72-33314
Jet aircraft gas turbine engine technology impact on safety, reliability, airline profitability and international trade
- A72-33315
NASA/General Electric joint development of low noise propulsion technology, describing demonstrator engine A design, components development and aerodynamic/acoustic performance evaluation [AIAA PAPER 72-657] A72-34077
- ENGINE INLETS**
Integrated data acquisition and processing system for inlet-aircraft engine matching, considering all-digital, analog and hybrid approach A72-32319
- ENGINE NOISE**
Lift fan blade interaction discrete frequency noise, discussing potential and viscous interactions relation to rotor-stator spacing A72-32019
- Low noise aircraft-engine configuration feasibility, discussing turbofan engine noise reduction A72-32322
- NASA/General Electric joint development of low noise propulsion technology, describing demonstrator engine A design, components development and aerodynamic/acoustic performance evaluation [AIAA PAPER 72-657] A72-34077
- Analysis of effect of aerodynamically-induced fluctuation forces on sound produced by axial flow compressor rotor and stator combinations [NASA-CR-2012] N72-23991
- ENGINE PARTS**
Aircraft gas turbine engine Ni base alloy disks and shafts thermomechanical treatment, considering yield strength and high and low cycle fatigue resistance A72-33299
- Mechanical properties of gas turbine vanes and disks [JPRS-55987] N72-24825
- Mechanical properties of gas turbine disk material after operation N72-24827
- Purge system and components of HRE AIM [NASA-CR-112060] N72-25715
- ENGINES**
Characteristics and advantages of flapping wing engine over screw engine N72-24118
- ENVIRONMENT SIMULATION**
Instrument landing system simulator including special signal generator for environment simulation [RAE-TR-71145] N72-25607
- ENVIRONMENTAL CONTROL**
Private and governmental regulatory aspects of environmental noise abatement and control, discussing legal efforts and trends at local, state and federal levels A72-32614
- Aero engines and propulsion systems development contribution to air transport economics and regularity, considering environmental factors A72-33313
- ENVIRONMENTAL TESTS**
Prediction models for dynamic environment experienced by cargo during air and rail transportation A72-32610
- Low temperature environmental chamber for F-111 proof load testing, describing components of cold air forced convection recirculation system with liquid nitrogen injection A72-32612
- Dynamic input to cargo in turbojet aircraft studied during C141 and C5A flights, discussing

- instrumentation, test procedures, data reduction processes and results
A72-32625
- Durability tests on components of VFW-H3 gyrodyne with determination of rotary wing fatigue life [NASA-TT-F-14284] N72-24023
- Aerodynamic characteristics and performance of OH-6 helicopter with emphasis on flight loads imposed during combat operations [AD-738202] N72-24032
- EPOXY COMPOUNDS**
- Epoxy and silicone rubber molding of ice structures and ice-coated airplane wings [NEMO-82] N72-24611
- EROSION**
- End oriented, fiber reinforced plastic composites as rain erosion resistant materials [AD-738079] N72-24616
- Chemical and structural properties of urethane elastomers and resistance to rain erosion [AD-737624] N72-24618
- ERROR ANALYSIS**
- Error analysis for digital avionics system involving Doppler navigation by intermittent scanning of single beam multimode radar, noting optimum statistical data processing A72-32204
- EUROPE**
- Scientific articles on research and development in Europe [AD-737607] N72-24353
- EXHAUST GASES**
- Climatic changes due to stratospheric perturbation by propulsion effluents of high altitude aircraft flights [AIAA PAPER 72-658] A72-34076
- SST contrails stratospheric dispersion by aircraft wake, atmospheric turbulence and exhaust gases temperature induced buoyancy [AIAA PAPER 72-650] A72-34084
- Air pollution for peak traffic periods at Heathrow Airport, London, for April through September for 1970 N72-24649
- Analysis of sources, constituents, and influence of operating conditions on emission characteristics of jet engine exhaust [NASA-TM-X-68064] N72-24830
- Analytical measurements of exhaust emissions from aircraft turbine engines using Jet A fuel [BM-RI-7634] N72-25584
- Analysis of emissions from aircraft piston and gas turbine engines - tables [PB-207107] N72-25589
- Checkout of multipoint sampling rake and exhaust emission of turbofan engines [PB-207321] N72-25593
- EXPLOSIVE FORMING**
- Explosive compaction and welding for low cost production of helicopter and turbine structural components [AD-737719] N72-24542
- EXPLOSIVE WELDING**
- Explosive compaction and welding for low cost production of helicopter and turbine structural components [AD-737719] N72-24542
- EXTERNAL STORES**
- Simulator for physical forces experienced by carrier aircraft during catapult launches and arrested landings, considering external stores safe suspension A72-32620
- EXTERNALLY BLOWN FLAPS**
- Review of work on external flow jet flaps noting lift coefficient [ARC-CP-1194] N72-24998
- F**
- F-8 AIRCRAFT**
- Flight test of F-8 aircraft to determine minimum time energy climbs based on energy state approximation [AD-738018] N72-24035
- F-111 AIRCRAFT**
- Low temperature environmental chamber for F-111 proof load testing, describing components of cold air forced convection recirculation system with liquid nitrogen injection A72-32612
- FAIL-SAFE SYSTEMS**
- Fatigue assessment of safe life and fail-safe structures [ARL/SM-REPT-334] N72-25899
- FAILURE ANALYSIS**
- Investigating failure of gas turbine vanes under influence of thermal cycles in simulated modes of engine start-up and shut down N72-24815
- FAR FIELDS**
- Far field sonic boom approach effects, describing Whitham theory extension for ultimate N wave deviations for body configurations with continuous or discontinuous tangent A72-33010
- FATIGUE (MATERIALS)**
- Effect of oxidation-resistant coatings on fatigue strength of nickel-based alloy for turbine engine blades [JPRS-55972] N72-24608
- FATIGUE LIFE**
- Adhesive bonding of L-1011 body shell panels for improved fatigue strength and corrosion resistance A72-32429
- Aircraft gas turbine engine Ni base alloy disks and shafts thermomechanical treatment, considering yield strength and high and low cycle fatigue resistance A72-33299
- Durability tests on components of VFW-H3 gyrodyne with determination of rotary wing fatigue life [NASA-TT-F-14284] N72-24023
- Fatigue strength and durability of gas turbine vane models under isothermal and temperature changing conditions N72-24826
- Fatigue assessment of safe life and fail-safe structures [ARL/SM-REPT-334] N72-25899
- FATIGUE TESTS**
- Cost-saving techniques in helicopter structural test methods, suggesting system simulation, component replacement time calculation and computer techniques A72-33221
- FEDERAL BUDGETS**
- Budget management for modernization and expansion of airports N72-24337
- FEEDBACK CONTROL**
- Suboptimal feedback control for aircraft gust alleviation design, using indirect perturbation information through normal acceleration factor measurement A72-32025
- Hydrofluidic three-axis stability augmentation system to improve OH-1B helicopter damping and handling qualities during high speed gunfiring missions A72-33650
- FENCES (BARRIERS)**
- Scale model tests of high thrust engine blast deflection fence combinations for protection of adjacent roadway traffic A72-33698
- FIBERS**
- Thermal aspects of using filamentary composite materials for airframes on atmospheric entry spacecraft [SD-72-SR-0015] N72-25542
- FIELD STRENGTH**
- Electromagnetic waves penetration through conducting gasket used to protect sensitive devices in aircraft, investigating field strength variation with distance from gasket A72-32571
- FIGHTER AIRCRAFT**
- Optimum low noise engine selection for transport and combat aircraft relative to range or payload performance, considering CTOL, VTOL, SST and fighter aircraft A72-32127
- Pontryagin minimum principle applied to aircraft heading change and aircraft interception [ETN-4] N72-24007
- FINANCIAL MANAGEMENT**
- Military systems cost reduction via civil avionics

SUBJECT INDEX

FLIGHT SAFETY

- procurement techniques, discussing
cost-reliability design criteria A72-32215
- Financial methods employed in creating Brazilian
aircraft industry via mixed public-private
ownership A72-33375
- Budget management for modernization and expansion
of airports N72-24337
- FINITE DIFFERENCE THEORY**
- Transonic airfoil section design to given surface
pressure distribution, applying finite
difference procedures to transonic small
disturbance equations
[AIAA PAPER 72-679] A72-34062
- FIRE PREVENTION**
- Performance of self-sealing breakaway valves in
preventing fuel spillage and fires in survival
aircraft crashes
[AD-738204] N72-24547
- FLAME STABILITY**
- Rotating flow introduction effects on jet noise
levels, combustion and turbulent mixing
processes and flame stability
[AIAA PAPER 72-645] A72-34087
- FLAPPING**
- Hingeless elastic helicopter blades coupled
flap-lag motion under quasi-steady aerodynamic
loads, reducing equations of motion to coupled
nonlinear differential equations A72-31211
- FLAPS (CONTROL SURFACES)**
- Large-scale wind tunnel investigation of noise
characteristics of semispan wing equipped with
externally blown jet flaps
[NASA-TN-X-62154] N72-24011
- FLAT PLATES**
- Blade characteristics of axial flow fan with
orifice fan guide investigation by theoretical
model with flat plate parallel to wing tip surface
A72-32142
- FLEXIBLE WINGS**
- Inclined wind tunnel test section for free gliding
investigation and aerodynamic design of flexible
wing two body system A72-31403
- Flexible wing applications to passenger and cargo
transport, discussing gliding and soaring sport,
emergency use, powered flight, rocket payload
recovery, etc A72-33182
- Characteristics and advantages of flapping wing
engine over screw engine N72-24118
- FLIGHT ALTITUDE**
- Aircraft geodetic coordinates computation from
radar range measurements and flight altitude
over earth ellipsoid A72-31601
- FLIGHT CHARACTERISTICS**
- Aircraft flight characteristics for landing
approach by spoiler-elevator deflection
coupling, considering pitch, flight path angle
and speed A72-33423
- Integrated airborne-ground based instrumentation
system for variable stability X-22A aircraft
flying qualities research, discussing telemetry,
mobile van, landing aids and airplane design
A72-33628
- Relationship between static pressure error
/position error/ and measurable flight
parameters for different aircraft weights and
configurations A72-33637
- Flight test instrumentation system for measurement
of aircraft performance, stability and control
characteristics during nonsteady flight A72-33639
- Aircraft instrumentation system accuracy relation
to aerodynamic derivatives evaluated from flight
data, proposing input and transient response
measurement system A72-33640
- Russian book on flight dynamics covering
horizontal flight, takeoff, climb and landing
characteristics, meteorological conditions,
helicopters, trajectory problems, stability and
controllability analysis, etc A72-33874.
- Statistical analysis of mission profiles for
passenger- and cargo-transport aircrafts
[TB-88] N72-25002
- FLIGHT CONTROL**
- Jaguar powered flight controls, discussing wing
spoilers, slab tailplane, rudder,
autostabilization system and integrated
packaging of actuators A72-34144
- Bibliography of control devices to provide
improved tactical agility for jet fighter aircraft
[AD-737694] N72-24036
- Tests of pneumatic servomechanism for use in
aircraft control systems
[AD-738345] N72-24544
- FLIGHT CREWS**
- Development of standardized method for evaluating
physical geometry of aircrew stations - Vol. 1
[AD-738006] N72-25015
- Computer programs for improved methods for
evaluating physical compatibility of crew
members with crew stations - Vol. 3
[AD-738007] N72-25016
- Development of mathematical model for evaluating
compatibility of flight crew personnel and
aircraft crew stations - Vol. 4
[AD-738008] N72-25017
- Validation of man-model joint movement parameters
to determine compatibility of flight crews and
aircraft compartments - Vol. 5
[AD-738009] N72-25018
- FLIGHT HAZARDS**
- Accidents involving rotorcraft in US general
aviation for calendar year 1970
[NTSB-AMM-72-3] N72-24019
- Aircraft accident report concerning DC-9 aircraft
contact with ocean surface and subsequent
emergency landing at Martha's Vineyard,
Massachusetts, June 22, 1971
[PB-207101] N72-25013
- FLIGHT OPTIMIZATION**
- Jet lift VTOL flight path optimization for minimum
landing transition distance, evaluating
deceleration as function of incidence and thrust
vector angles A72-32323
- FLIGHT PATHS**
- Head-up display for aircraft three dimensional sky
path observation during navigation and landing,
discussing computer units, CRT and image
generating subsystems A72-32042
- Great circle intermediate waypoint computation
method for inertial navigation equipped aircraft
A72-32205
- Jet lift VTOL flight path optimization for minimum
landing transition distance, evaluating
deceleration as function of incidence and thrust
vector angles A72-32323
- Flight tests to determine effects of various
approach angles on performance of executive
transport jet aircraft
[FAA-PS-600-7] N72-24022
- FLIGHT RECORDERS**
- STRADA landing trajectory recording system for
real time flight path restitution during
approach and landing, using computer and lidar
techniques A72-32895
- FLIGHT SAFETY**
- Avionics equipment for signal processing onboard
civil aircraft to improve flight safety,
discussing uses of OMEGA navigation system and
digital computers A72-31178
- Civil aviation safety - Conference, Beirut,
Lebanon, November-December 1971 A72-33326
- FAA policy in issuing civil airport operating
certificates and establishing minimum safety
standards A72-33330
- Analysis of US general aviation aircraft accidents
for calendar year 1969 N72-25003

FLIGHT SIMULATION

SUBJECT INDEX

FLIGHT SIMULATION

Cost-saving techniques in helicopter structural test methods, suggesting system simulation, component replacement time calculation and computer techniques

A72-33221

FLIGHT SIMULATORS

Low cost flight simulator for general aviation pilot training, containing IFB instrumentation and turbulence injection device

A72-32211

Flight training simulator criteria and design considerations, noting avionics, model aircraft, control console and teaching aspects

A72-33501

Flight simulator facility emphasizing lateral-directional control
[NASA-TM-X-62155]

N72-24335

Evaluation cockpit and control by variable stability system in total in-flight simulator
[AD-738314]

N72-24357

Fixed base simulator study of direct lift control on VC-10 aircraft
[ARC-CP-1199]

N72-25010

FLIGHT STABILITY TESTS

Flight test instrumentation system for measurement of aircraft performance, stability and control characteristics during nonsteady flight

A72-33639

FLIGHT TEST INSTRUMENTS

DAMEN III digital magnetic tape recording system for aircraft flight test data acquisition, discussing components

A72-33629

Flight test instrumentation system for measurement of aircraft performance, stability and control characteristics during nonsteady flight

A72-33639

Serial PCM system for flight test data acquisition and reduction compared with Harrier system

A72-33644

FLIGHT TESTS

Inclined wind tunnel test section for free gliding investigation and aerodynamic design of flexible wing two body system

A72-31403

Flight experiments to determine horizontal visual restriction effects on T-33 aircraft front cockpit during approaches and landings

A72-31697

Dynamic input to cargo in turbojet aircraft studied during C141 and C5A flights, discussing instrumentation, test procedures, data reduction processes and results

A72-32625

Autoland system flight testing in Trident 3B and British Civil Aviation Authority approval for ICAO Cat 3a weather

A72-33539

Airborne flight test data acquisition system modular design to provide digital readings from monitoring transducers analog signal

A72-33645

SECANT collision avoidance system, describing operational principles and flight test results

A72-34137

Design, development, and evaluation of glass-reinforced epoxy rotor blades on CH-47 helicopter
[AD-738203]

N72-24033

Flight test of F-8 aircraft to determine minimum time energy climbs based on energy state approximation
[AD-738018]

N72-24035

Maximum likelihood parameter estimation for extracting stability and control derivatives of aircraft from flight test data using real time digital computer
[NASA-TN-D-6735]

N72-24625

Applications of computers for flight test and evaluation of helicopters based on frequency analyses of load curves on main and tail rotors
[NASA-TT-F-14283]

N72-24993

Flight tests of EC-130E aircraft with I band radome installed
[ENEA-71-45]

N72-25007

FLIGHT TIME

Aircraft on-time operation and air traffic problems, considering solution requirement

formulation and funding suggestions

A72-32462

FLIGHT TRAINING

Military aviation navigator training, discussing objectives, methods, instructors and equipment

A72-32207

Canadian Armed Forces air navigation training program, noting emphasis on training flights

A72-32209

USAF Academy air navigation training program, discussing systems development course and descriptive and applied astronomy

A72-32210

Flight training simulator criteria and design considerations, noting avionics, model aircraft, control console and teaching aspects

A72-33501

FLOW DISTORTION

Unsteady response of turbocompressor with inlet flow distorted by square wave and triangular spoilers

N72-25000

FLOW DISTRIBUTION

Sonic boom alleviation by flow field alteration near supersonic aircraft, considering finite rise times, reduced overpressures and shock pressure rises

A72-34081

Sonic boom induced flow field at supersonic/hypersonic speeds, using shock expansion method and hypersonic equivalence principle for sharp and blunt nosed bodies
[AIAA PAPER 72-653]

A72-34082

Development of computer program to determine aerodynamic characteristics of airfoils under conditions of zero trailing edge angle
[AD-738318]

N72-24003

Analysis of leading edge flow separation resulting from airfoils oscillating in uniform flow field at low Reynolds numbers

N72-25320

Aerothermodynamic integration model, including combustor design, flow distribution, and heat transfer problems
[NASA-CR-112058]

N72-25713

FLOW EQUATIONS

Elliptic-hyperbolic relaxation algorithm for solution to three dimensional nonlinear transonic small disturbance potential equation for flow about swept wings
[AIAA PAPER 72-677]

A72-34063

FLOW MEASUREMENT

Laser Doppler velocimetry system design for optical measurement of intrablade flow velocity in turbomachinery

A72-32045

Main methods of fuel flow measurement and factors for consideration in deciding on type of meter to use for various requirements
[AGARDGRAPH-160-VOL-3]

N72-25420

Development and characteristics of dual scatter laser Doppler velocimeter for flow distribution measurement in wind tunnels, helicopter downwash, and across high lift wing sections

N72-25506

FLOW VELOCITY

Contracting or diverging stream flow mean velocity change effects on airfoil pressure distribution, circulation and lift, deriving vortex distribution expression

A72-32023

Subsonic wind tunnel for pulsed flows with speed modulation as periodic function of time

A72-32898

Monitor and regulator for automatic speed control and flow velocity measurement in wind tunnel

A72-33609

FLUID FLOW

Rotating flow introduction effects on jet noise levels, combustion and turbulent mixing processes and flame stability
[AIAA PAPER 72-645]

A72-34087

FLUIDICS

Hydrofluidic three-axis stability augmentation system to improve UH-1B helicopter damping and handling qualities during high speed gunfiring missions

A72-33650

FLUTTER

Dynamic theory of flutter for rotation of rigid wing
[ARL/SM-332] N72-24996

FLUTTER ANALYSIS

Aeroelasticity, discussing gust and maneuver load
alleviation, flutter suppression, aircraft
stability, computerized aeroelastic analysis,
aeroelastic optimization, composite structures,
etc

A72-31202

FOG

Airport runway fog dispersal in UK, discussing
cost projection for chemical seeding system
combined with lidar remote sensing

A72-33500

FOKKER AIRCRAFT

Fokker VTOL transport aircraft designs,
considering payload, range, runway conditions,
noise, military capabilities and operational costs

A72-33048

FORECASTING

Individual regions and nationwide air traffic
demands forecasting for airport planning

A72-33311

Major civil airport planning, discussing
information gathering and processing for
aviation demand, aircraft movements revenue and
cost forecasts and pricing policy evaluation

A72-33327

Major civil airport development plan, discussing
traffic forecasts, runways, noise, airspace
capacity, access systems, freight installations,
maintenance facilities, navigation aids,
buildings, etc

A72-33328

Forecasts of aviation activity for fiscal years
1972 to 1973 to indicate expected status of
commercial and general aviation

N72-24034

FRACTURE MECHANICS

Fracture mechanics and crack behavior of steel
plate and forging materials for aircraft

N72-24601

FREE FLIGHT

Inclined wind tunnel test section for free gliding
investigation and aerodynamic design of flexible
wing two body system

A72-31403

FREE FLIGHT TEST APPARATUS

Free flight follower support system with data
reduction for V/STOL or helicopter models,
recording flight path and attitude angles

A72-32886

FREE VIBRATION

Nonlinear analysis of helicopter rotor blade free
transverse vibration under air and centrifugal
loadings during forward flight, using matrix
method

A72-31407

Natural frequencies and vibration modes of free
glider, using symmetrical matrix to replace
three dimensional structure by approximate model

A72-33409

FREQUENCY CONTROL

Time/frequency technology application to reliable
aircraft collision avoidance system, discussing
precision time-ordered techniques, frequency
control and synchronization and flying clocks

A72-32072

FREQUENCY DISTRIBUTION

Time/frequency techniques in land, sea and air
transportation environments, discussing
characteristics and electronic traffic control
systems applications

A72-32073

FREQUENCY MODULATION

Adaptive narrow band, frequency modulation, voice
communication system

N72-25783

FREQUENCY SYNCHRONIZATION

Time/frequency technology application to reliable
aircraft collision avoidance system, discussing
precision time-ordered techniques, frequency
control and synchronization and flying clocks

A72-32072

FUEL FLOW

Main methods of fuel flow measurement and factors
for consideration in deciding on type of meter
to use for various requirements

[AGARDOGRAPH-160-VOL-3]

N72-25420

FUEL PUMPS

Method for evaluating liquid pump operational and
functional performance characteristics

[AD-737713] N72-24541

FUEL VALVES

Performance of self-sealing breakaway valves in
preventing fuel spillage and fires in survival
aircraft crashes

[AD-738204] N72-24547

G**GAS TURBINE ENGINES**

RB 211 three-shaft turbofan engine for L-1011
airliner, describing design for noise reduction

A72-32428

Aircraft gas turbine engine Ni base alloy disks
and shafts thermomechanical treatment,
considering yield strength and high and low
cycle fatigue resistance

A72-33299

Jet aircraft gas turbine engine technology impact
on safety, reliability, airline profitability
and international trade

A72-33315

Investigating failure of gas turbine vanes under
influence of thermal cycles in simulated modes
of engine start-up and shut down

N72-24815

Statistical analysis of tensile strength and creep
data on gas turbine engine alloys

[JPRS-56002] N72-24824

Mechanical properties of gas turbine vanes and disks

[JPRS-55987] N72-24825

Fatigue strength and durability of gas turbine
vane models under isothermal and temperature
changing conditions

N72-24826

Mechanical properties of gas turbine disk material
after operation

N72-24827

Analysis of emissions from aircraft piston and gas
turbine engines - tables

[PB-207107] N72-25589

GAS TURBINES

Mechanical properties of high temperature steels
and alloys for gas turbine rotors, disks and
blades

A72-31703

GENERAL AVIATION AIRCRAFT

Low cost flight simulator for general aviation
pilot training, containing IFB instrumentation
and turbulence injection device

A72-32211

Aircraft accidents involving corporate executive
aircraft in US general aviation for calendar
year 1970

[NTSB-AMM-72-5] N72-24017

Aircraft accidents involving air taxi operations
in US general aviation for calendar year 1970

[NTSB-AMM-72-4] N72-24018

Flight tests to determine effects of various
approach angles on performance of executive
transport jet aircraft

[FAA-PS-600-7] N72-24022

Forecasts of aviation activity for fiscal years
1972 to 1973 to indicate expected status of
commercial and general aviation

[AD-738360] N72-24034

Passenger, cargo, and mail statistics for computer
air carriers FY 1971

N72-24981

Capital cost analysis of airport alternatives for
San Francisco Bay area for general aviation and
commercial aircraft

N72-24985

Analysis of US general aviation aircraft accidents
for calendar year 1969

N72-25003

Review of U.S. general aviation accidents for 1969

[NTSB-ARG-71-1] N72-25004

Computer program for predicting performance,
noise, weight, and cost of general aviation
aircraft propellers for 1980 time period

[NASA-CR-2066] N72-25005

GEODETIC COORDINATES

Aircraft geodetic coordinates computation from
radar range measurements and flight altitude

GEOMAGNETISM

SUBJECT INDEX

over earth ellipsoid A72-31601

GEOMAGNETISM
Approximate compensation in airborne magnetometry for changing inductive field of aircraft moving through varying geomagnetic field N72-25435

GERMANY
Airport planning in West Germany discussing surface transport facilities and pollution [DGLR-PAPER-71-075] N72-24986

GLIDE LANDINGS
Tactical approach landing radar tests for low lift drag ratio aircraft in unpowered flight, using F-104D as test aircraft A72-31694

GLIDE PATHS
Evaluation of STOL modular instrument landing system [FAA-NA-72-11] N72-25605

GLIDERS
Natural frequencies and vibration modes of free glider, using symmetrical matrix to replace three dimensional structure by approximate model A72-33409

GLIDING
Inclined wind tunnel test section for free gliding investigation and aerodynamic design of flexible wing two body system A72-31403

GOVERNMENT/INDUSTRY RELATIONS
Developing countries civil aviation airlines evolution, considering government fund allocation, international money credibility, skilled manpower, equipment, fare and tourism expansion A72-33332
Government regulations effects on local service airlines cost performance and growth strategies A72-33374
Financial methods employed in creating Brazilian aircraft industry via mixed public-private ownership A72-33375
Papers presented at conference on system safety in government and industry [NASA-TM-X-68369] N72-25961

GOVERNMENTS
FAA national policies on overall missions and criteria for major subsystems [REPT-1000.27-APP-1] N72-25949
National aviation system plan 1973-1982, as joint industry-government program [REPT-1000.27-APP-2] N72-25950

GREAT BRITAIN
Air pollution for peak traffic periods at Heathrow Airport, London, for April through September for 1970 N72-24649

GREAT CIRCLES
Great circle intermediate waypoint computation method for inertial navigation equipped aircraft A72-32205

GROUND BASED CONTROL
Solid state modular ground based distance measuring equipment /DME/ receiver for en route aircraft navigation and landing A72-33521

GROUND EFFECT
Lift and induced drag characteristics of jet flapped finite span wings in close proximity to ground, using method of matched asymptotic expansions A72-32827

GROUND EFFECT MACHINES
Arctic environment surface effect vehicle design, considering structures, drag, lift, propulsive power and range A72-32125
Air cushion landing system application for civil air transportation, discussing operation, braking and parking A72-33184

GROUND HANDLING
Air cargo intermodal and interline containers handling in warehouse storage, transportation and distribution, considering total pack and interlock requirements A72-33174

GROUND SUPPORT EQUIPMENT
Integrated airborne-ground based instrumentation system for variable stability X-22A aircraft flying qualities research, discussing telemetry, mobile van, landing aids and airplane design A72-33628
Integrated civil/military ATC system for upper airspace control /UAC/ center at Karlsruhe A72-34108
Mediator plan for joint civil/military ATC organization at London center, discussing sectorization, control and radar facilities, flight plan processing and communications A72-34109

GROUND SUPPORT SYSTEMS
Aircraft industry product support role in time delays minimization for aircraft operators, discussing malfunction report, minimum equipment decision and fault diagnosis A72-32456

GROUND TESTS
Statistical correlation techniques applied to jet aircraft autoland system dynamic ground tests with simulated engine and aerodynamic characteristics A72-33641

GROUND-AIR-GROUND COMMUNICATIONS
Location identification system with ground based transmitter and aircraft borne receiver/decoder [NASA-CASE-ERC-10324] N72-25173

GUIDANCE SENSORS
Doppler navigation system suitability for area navigation, discussing routes versatility, accuracy and continuous velocity vector sensor A72-32203

GUST ALLEVIATORS
Aeroelasticity, discussing gust and maneuver load alleviation, flutter suppression, aircraft stability, computerized aeroelastic analysis, aeroelastic optimization, composite structures, etc A72-31202
Suboptimal feedback control for aircraft gust alleviation design, using indirect perturbation information through normal acceleration factor measurement A72-32025

GUST LOADS
Bending and torsional mode deformations of two dimensional elastic wing under sinusoidal and random gust A72-33229
Effects of gusts, maneuvers, and landing impacts on four-engine cargo aircraft during commercial airlines operation [NASA-TN-D-6790] N72-24015

GYROCOMPASSES
Coordinate and speed error dependence on instrumental errors of inertial navigation system using gyrohorizoncompass A72-33960

GYRODYNE AIRCRAFT
Durability tests on components of VFW-R3 gyrodyne with determination of rotary wing fatigue life [NASA-TT-P-14284] N72-24023

H

HAIL
Hail size distribution and concentration in thunderstorm updraft regions from aircraft and S band radar observations A72-33946

HANDLING EQUIPMENT
Air cargo intermodal and interline containers handling in warehouse storage, transportation and distribution, considering total pack and interlock requirements A72-33174
Terminal handling environment and air cargo requirements for noncontainerized freight A72-33175

HEAT RESISTANT ALLOYS
Mechanical properties of high temperature steels and alloys for gas turbine rotors, disks and blades A72-31703
Statistical analysis of tensile strength and creep data on gas turbine engine alloys

- [JPBS-56002] N72-24824
HEAT TRANSFER
 Aerothermodynamic integration model, including combustor design, flow distribution, and heat transfer problems
 [NASA-CR-112058] N72-25713
HEAT TREATMENT
 Aircraft gas turbine engine Ni base alloy disks and shafts thermomechanical treatment, considering yield strength and high and low cycle fatigue resistance
 A72-33299
HELICOPTER CONTROL
 Hydrofluidic three-axis stability augmentation system to improve UH-1B helicopter damping and handling qualities during high speed gunfiring missions
 A72-33650
HELICOPTER DESIGN
 Civil helicopter electronic display requirements contrasted with fixed wing aircraft
 A72-32633
HELICOPTER PERFORMANCE
 Free flight follower support system with data reduction for V/STOL or helicopter models, recording flight path and attitude angles
 A72-32886
 Development and characteristics of system for providing short term attitude holding and stabilization of helicopters
 [AD-737707] N72-24031
 Aerodynamic characteristics and performance of OH-6 helicopter with emphasis on flight loads imposed during combat operations
 [AD-738202] N72-24032
HELICOPTERS
 Nonlinear analysis of helicopter rotor blade free transverse vibration under air and centrifugal loadings during forward flight, using matrix method
 A72-31407
 Hierarchical system of helicopter service terminals, calculating passenger lots for single and multiloop arrangements under given stochastic input conditions
 A72-31498
 Cost-saving techniques in helicopter structural test methods, suggesting system simulation, component replacement time calculation and computer techniques
 A72-33221
 Russian book on flight dynamics covering horizontal flight, takeoff, climb and landing characteristics, meteorological conditions, helicopters, trajectory problems, stability and controllability analysis, etc
 A72-33874
 Accidents involving rotorcraft in US general aviation for calendar year 1970
 [NTSB-AMN-72-3] N72-24019
 Development and characteristics of system for providing short term attitude holding and stabilization of helicopters
 [AD-737707] N72-24031
 Development of methods for determining lifetime of helicopter components based on working stress and stress-time functions
 [NASA-TT-F-14280] N72-24531
 Explosive compaction and welding for low cost production of helicopter and turbine structural components
 [AD-737719] N72-24542
 Applications of computers for flight test and evaluation of helicopters based on frequency analyses of load curves on main and tail rotors
 [NASA-TT-F-14283] N72-24993
HIERARCHIES
 Hierarchical system of helicopter service terminals, calculating passenger lots for single and multiloop arrangements under given stochastic input conditions
 A72-31498
HIGH TEMPERATURE TESTS
 Thermal simulation tests for kinetic heating of aerospace structures and materials, describing facilities for supersonic flight and atmospheric reentry
 A72-32897
- HISTORIES**
 Illustrated biography of Wiley Post to record significant accomplishments in long range flight and aeronautical engineering
 N72-25952
HOLOGRAPHY
 Digital recording techniques for airborne data acquisition, emphasizing laser beam holographic recorders
 A72-33642
HOMING DEVICES
 Location identification system with ground based transmitter and aircraft borne receiver/decoder
 [NASA-CASE-ERC-10324] N72-25173
HORIZONTAL TAIL SURFACES
 Jaguar powered flight controls, discussing wing spoilers, slab tailplane, rudder, autostabilization system and integrated packaging of actuators
 A72-34144
HOT-WIRE ANEMOMETERS
 Wind tunnel test data of velocity measurements with hot wire anemometer in wake of CV-990 aircraft model
 [NASA-TM-X-62148] N72-23994
HOVERING STABILITY
 V/STOL weapon system VJ-101 design, discussing one axis rocking device, suspension structure and hovering flight thrust control
 A72-33049
 Mathematical model for influence of lift engine position on eigenmotion of lift jet powered VTOL aircraft in hovering flight
 [DLR-FB-71-112] N72-24028
HUMAN FACTORS ENGINEERING
 Computerized navigator training simulator for complete array of air navigation instruments, discussing design and human factors
 A72-32208
 Development of standardized method for evaluating physical geometry of aircrew stations - Vol. 1
 [AD-738006] N72-25015
 Computer programs for improved methods for evaluating physical compatibility of crew members with crew stations - Vol. 3
 [AD-738007] N72-25016
 Development of mathematical model for evaluating compatibility of flight crew personnel and aircraft crew stations - Vol. 4
 [AD-738008] N72-25017
 Validation of man-model joint movement parameters to determine compatibility of flight crews and aircraft compartments - Vol. 5
 [AD-738009] N72-25018
 Pilot safety considerations in design and operation of X-24A lifting body vehicle
 N72-25969
HUMAN TOLERANCES
 Acceptability of VTOL aircraft noise determined by test subjects evaluating simulated sounds of helicopter, tilt wing aircraft, and turbojet aircraft
 [NASA-CR-2043] N72-24025
 Noise exposure forecasts for airport vicinity in land use management
 [ISAS-476-VOL-37-NO-2] N72-24344
HYDRAULIC CONTROL
 Hydrofluidic three-axis stability augmentation system to improve UH-1B helicopter damping and handling qualities during high speed gunfiring missions
 A72-33650
HYDRAULIC EQUIPMENT
 Polyimide hydraulic actuator rod seals for application in high performance aircraft
 [NASA-CR-120878] N72-24530
HYDROCARBON FUELS
 Effects of additives on hydrocarbon jet fuel stability
 [AD-737833] N72-24806
HYPERSONIC AIRCRAFT
 Wind tunnel tests to determine effects of variations in body shape on aerodynamic characteristics of all-body hypersonic aircraft configuration
 [NASA-TN-D-6821] N72-23996
HYPERSONIC FLOW
 Experimental method for measuring heat transfer in hypersonic aerodynamic models

- [REPT-32] N72-25918
HYPERSONIC SPEED
 Sonic boom induced flow field at supersonic/hypersonic speeds, using shock expansion method and hypersonic equivalence principle for sharp and blunt nosed bodies [AIAA PAPER 72-652] A72-34082
- ICE FORMATION**
 Epoxy and silicone rubber molding of ice structures and ice-coated airplane wings [MEMO-82] N72-24611
- IMAGING TECHNIQUES**
 Head-up display for aircraft three dimensional sky path observation during navigation and landing, discussing computer units, CRT and image generating subsystems A72-32042
 Aircraft electronic display for pilot precise control in complex tasks, discussing clarity, stability and readability of CRT images A72-32632
- IMPACT DAMAGE**
 Probabilistic analysis of aircraft crash-caused structural damage to nuclear power plant, using Monte Carlo method and yield line theory for perforation and collapse modes A72-33600
- IMPACT LOADS**
 Axisymmetric jet impact on ground board for different nozzle configurations and heights in VTOL aircraft aerodynamic studies A72-33404
- IN-FLIGHT MONITORING**
 Avionics effects on airline operations timekeeping, considering gains due to all-weather capability and engine monitoring vs possible losses due to equipment failures A72-32461
- INCOMPRESSIBLE FLOW**
 Aerodynamic properties prediction procedure for thin jet-flapped airfoil in incompressible inviscid flow bounded by different types of boundaries A72-32147
- INCOMPRESSIBLE FLUIDS**
 Turbulent flow between rotating disk and turbine engine body calculated from equations of axisymmetric viscous incompressible fluid flow A72-31702
- INDUSTRIES**
 National aviation system plan 1973-1982, as joint industry-government program [REPT-1000.27-APP-2] N72-25950
- INERTIAL GUIDANCE**
 Fighter bomber Loran-inertial data processing with digital computer to combine navigation, guidance and weapon delivery into fully integrated system A72-33246
- INERTIAL NAVIGATION**
 Aircraft inertial navigation system, discussing mode selection unit, digital computer and control display for operator communication with system A72-31596
 Great circle intermediate waypoint computation method for inertial navigation equipped aircraft A72-32205
 Coordinate and speed error dependence on instrumental errors of inertial navigation system using gyrohorizoncompass A72-33960
 Integrated inertial-VOR-DME or inertial-TACAN navigation system, presenting slant range and bearing adjustment procedure via least squares method A72-34136
 Development of air traffic control procedure using inertial navigation position reports as input data for computer graphics presentation [FAA-RD-71-92] N72-24673
- INFRARED RADIATION**
 IR radiant energy emission from conical jet exhaust of turbojet aircraft A72-32399
- INFRARED SCANNERS**
 Airborne external instrumentation pod containing IR scanner and associated test equipment for land and water surveys A72-33635
- INFRARED SPECTRA**
 Electromechanical device for recording infrared gaseous oxygen spectra in pressurized aircraft cabin atmosphere [CI-1971-16] N72-24498
- INLET FLOW**
 Unsteady response of turbocompressor with inlet flow distorted by square wave and triangular spoilers [ARC-CP-1203] N72-25000
- INSTRUMENT APPROACH**
 Flight evaluation of vectored-thrust-jet V/STOL aircraft during simulated instrument approaches using Kestrel (XV-6A) aircraft [NASA-TN-D-6791] N72-24012
 Aircraft accident involving DC-9 charter flight on instrument landing approach to Huntington, West Virginia airport on 14 November, 1970 [NTSB-AAR-72-11] N72-25006
- INSTRUMENT COMPENSATION**
 Integrated inertial-VOR-DME or inertial-TACAN navigation system, presenting slant range and bearing adjustment procedure via least squares method A72-34136
- INSTRUMENT ERRORS**
 Coordinate and speed error dependence on instrumental errors of inertial navigation system using gyrohorizoncompass A72-33960
- INSTRUMENT FLIGHT RULES**
 Low cost flight simulator for general aviation pilot training, containing IFB instrumentation and turbulence injection device A72-32211
- INSTRUMENT LANDING SYSTEMS**
 Tactical approach landing radar tests for low lift drag ratio aircraft in unpowered flight, using F-104D as test aircraft A72-31694
 Hybrid area navigation and microwave instrument landing system, discussing approach control and terminal guidance A72-32206
 Low cost microwave scanning beam landing systems for interim instrument landing system replacement in civil aviation A72-32217
 STRADA landing trajectory recording system for real time flight path restitution during approach and landing, using computer and lidar techniques A72-32895
 Autoland system flight testing in Trident 3B and British Civil Aviation Authority approval for ICAO Cat 3a weather A72-33539
 Criteria for installation of instrument landing systems and effects of siting on operation of system [DOT-FAA-6750.16] N72-24338
 Requirements for channel splitting to accommodate increased VHF omnirange navigation instrument landing systems, and distance measuring equipment facilities [PAPER-54-71/SC122-3] N72-25602
 Evaluation of STOL modular instrument landing system [FAA-NA-72-11] N72-25605
 Instrument landing system simulator including special signal generator for environment simulation [RAE-TR-71145] N72-25607
- INSTRUMENT PACKAGES**
 Airborne external instrumentation pod containing IR scanner and associated test equipment for land and water surveys A72-33635
- INTAKE SYSTEMS**
 Three dimensional boundary layer separation on slender bodies, delta wings and propulsion intake systems, reviewing computing techniques for interfering inviscid flow fields A72-32826
- INTERCEPTION**
 Pontryagin minimum principle applied to aircraft heading change and aircraft interception

[ETH-4] N72-24007
INVISCID FLOW
 Aerodynamic properties prediction procedure for thin jet-flapped airfoil in incompressible inviscid flow bounded by different types of boundaries A72-32147

J

JAGUAR AIRCRAFT
 Jaguar powered flight controls, discussing wing spoilers, slab tailplane, rudder, autostabilization system and integrated packaging of actuators A72-34144

JET AIRCRAFT
 Dynamic input to cargo in turbojet aircraft studied during C141 and C5A flights, discussing instrumentation, test procedures, data reduction processes and results A72-32625

Jet aircraft gas turbine engine technology impact on safety, reliability, airline profitability and international trade A72-33315

Statistical correlation techniques applied to jet aircraft autoland system dynamic ground tests with simulated engine and aerodynamic characteristics A72-33641

Bibliography of control devices to provide improved tactical agility for jet fighter aircraft [AD-737694] N72-24036

Tests of pneumatic servomechanism for use in aircraft control systems [AD-738345] N72-24544

Numerical analysis of finite amplitude waves generated by aircraft trailing vortices to indicate growth of waves on pair of parallel infinite vortices [AD-737859] N72-25012

JET AIRCRAFT NOISE
 Noise measurements during shock free and underexpanded operation modes of supersonic cold model jet at moderate exit Mach number A72-32017

Aerodynamic noise and structural fatigue failure research and test facility, concerning supersonic jet and V/STOL aircraft A72-32900

Rotating flow introduction effects on jet noise levels, combustion and turbulent mixing processes and flame stability [AIAA PAPER 72-645] A72-34087

Jet noise reduction by screen placed across jet flow, investigating acoustic properties, velocity and pressure in mixing zone [AIAA PAPER 72-644] A72-34088

Data correlation of jet noise total sound power and peak sideline overall sound pressure level for subsonic and supersonic convergent exhaust nozzles [AIAA PAPER 72-643] A72-34089

Acoustic attenuation and thrust loss incurred by shrouded multitube supersonic jet noise suppressor [AIAA PAPER 72-642] A72-34090

Supersonic jet noise mechanisms and scaling laws, studying acoustic fields for rectangular and axisymmetric nozzle configurations [AIAA PAPER 72-641] A72-34091

Theoretical acoustics applied to jet engine noise generation, propagation, and reduction studies N72-25632

Method for computing noise generated by standing and flying jet aircraft [ONERA-NT-187] N72-25636

JET BLAST EFFECTS
 Scale model tests of high thrust engine blast deflection fence combinations for protection of adjacent roadway traffic A72-33698

JET ENGINE FUELS
 Effects of additives on hydrocarbon jet fuel stability [AD-737833] N72-24806

Analytical measurements of exhaust emissions from aircraft turbine engines using Jet A fuel [BM-RI-7634] N72-25584

JET ENGINES

Design and development of turbotip lift fan for use with turbojet gas generator installed on V/STOL transport research aircraft [NASA-CR-120909] N72-24828

Analysis of sources, constituents, and influence of operating conditions on emission characteristics of jet engine exhaust [NASA-TM-X-68064] N72-24830

Magnetic force welding to form T joints between jet engine parts of dissimilar thickness [NASA-CASE-LEW-10533-2] N72-25479

JET EXHAUST

IR radiant energy emission from conical jet exhaust of turbojet aircraft A72-32399

Correlation of total sound power and peak sideline overall sound pressure level for subsonic and supersonic jets of aircraft engine exhaust [NASA-TM-X-68059] N72-24711

Analysis of sources, constituents, and influence of operating conditions on emission characteristics of jet engine exhaust [NASA-TM-X-68064] N72-24830

JET FLAPS

Aerodynamic properties prediction procedure for thin jet-flapped airfoil in incompressible inviscid flow bounded by different types of boundaries A72-32147

Lift and induced drag characteristics of jet flapped finite span wings in close proximity to ground, using method of matched asymptotic expansions A72-32827

Review of work on external flow jet flaps noting lift coefficient [ARC-CP-1194] N72-24998

JET FLOW

Axisymmetric jet impact on ground board for different nozzle configurations and heights in VTOL aircraft aerodynamic studies A72-33404

Jet noise reduction by screen placed across jet flow, investigating acoustic properties, velocity and pressure in mixing zone [AIAA PAPER 72-644] A72-34088

JET LIFT

Jet lift VTOL flight path optimization for minimum landing transition distance, evaluating deceleration as function of incidence and thrust vector angles A72-32323

JET MIXING FLOW

Jet noise reduction by screen placed across jet flow, investigating acoustic properties, velocity and pressure in mixing zone [AIAA PAPER 72-644] A72-34088

JET THRUST

STOL aircraft minimum noise takeoff trajectories determination, taking into account engine thrust and listeners distance from noise source [AIAA PAPER 72-665] A72-34072

K

KERNEL FUNCTIONS

Kernel function solution for pressure distribution over wing with oscillating control surfaces in subsonic flow [NLR-TR-70123-U] N72-24368

L

L-1011 AIRCRAFT

L-1011 propulsion, fuel, flight control, navigation, avionics, communication, electrical, environmental control and auxiliary power systems, discussing structure and high lift devices A72-32427

Adhesive bonding of L-1011 body shell panels for improved fatigue strength and corrosion resistance. A72-32429

LAMINAR FLOW

Contracting or diverging stream flow mean velocity change effects on airfoil pressure distribution, circulation and lift, deriving vortex distribution expression

LAND USE

SUBJECT INDEX

- LAND USE** A72-32023
Noise exposure forecasts for airport vicinity in land use management
[ISAS-476-VOL-37-NO-2] N72-24344
- LANDING AIDS**
Air cushion landing system application for civil air transportation, discussing operation, braking and parking A72-33184
Performance and problems of microwave guidance systems for aircraft approach and landing [RAE-TR-71186] N72-25606
- LANDING INSTRUMENTS**
Computerized aircraft landing measurement system for civil airport, using optical, seismic and IR sensors A72-33627
- LANDING LOADS**
Effects of gusts, maneuvers, and landing impacts on four-engine cargo aircraft during commercial airlines operation [NASA-TN-D-6790] N72-24015
Measurement of ground loads on OV-1 aircraft during landings on smooth and rough fields [AD-737752] N72-24030
- LANDING SIMULATION**
Simulator for physical forces experienced by carrier aircraft during catapult launches and arrested landings, considering external stores safe suspension A72-32620
Statistical correlation techniques applied to jet aircraft autoland system dynamic ground tests with simulated engine and aerodynamic characteristics A72-33641
- LANDING SITES**
Booster launch vehicle guidance scheme for critical aborts from staging through burnout, minimizing aerodynamic phases for different landing sites A72-32182
- LASER OUTPUTS**
Laser Doppler velocimetry system design for optical measurement of intrablade flow velocity in turbomachinery A72-32045
Digital recording techniques for airborne data acquisition, emphasizing laser beam holographic recorders A72-33642
Proceedings of conference on applications of laser technology for aerodynamic measurements [AGARD-LS-49] N72-25493
Development and characteristics of dual scatter laser Doppler velocimeter for flow distribution measurement in wind tunnels, helicopter downwash, and across high lift wing sections N72-25506
- LATERAL CONTROL**
Flight simulator facility emphasizing lateral-directional control [NASA-TM-X-62155] N72-24335
- LAW (JURISPRUDENCE)**
Private and governmental regulatory aspects of environmental noise abatement and control, discussing legal efforts and trends at local, state and federal levels A72-32614
Airport systems and grant programs under Airport and Airway Development Act of 1970 [AD-737040] N72-24352
Laws governing military use of civil aircraft N72-25960
- LEADING EDGES**
Leading edge boundary layer flow separation and reattachment processes in airfoil dynamic stall, considering effect of angle of attack rate of change A72-32024
Leading edge serrations effect on rotor noise and aerodynamic characteristics, noting vortex and rotational noise reduction and overall efficiency decrease [AIAA PAPER 72-655] A72-34079
Analysis of leading edge flow separation resulting from airfoils oscillating in uniform flow field at low Reynolds numbers
- [AD-738304] N72-25320
Aerothermodynamic integration model, including flow paths, leading edges, and ducts [NASA-CR-112059] N72-25714
- LEAKAGE**
Performance of self-sealing breakaway valves in preventing fuel spillage and fires in survival aircraft crashes [AD-738204] N72-24547
- LIFT**
Contracting or diverging stream flow mean velocity change effects on airfoil pressure distribution, circulation and lift, deriving vortex distribution expression A72-32023
Lift and induced drag characteristics of jet flapped finite span wings in close proximity to ground, using method of matched asymptotic expansions A72-32827
Review of work on external flow jet flaps noting lift coefficient [ARC-CP-1194] N72-24998
- LIFT DEVICES**
L-1011 propulsion, fuel, flight control, navigation, avionics, communication, electrical, environmental control and auxiliary power systems, discussing structure and high lift devices A72-32427
- LIFT DRAG RATIO**
Tactical approach landing radar tests for low lift drag ratio aircraft in unpowered flight, using F-104D as test aircraft A72-31694
Book on airfoil section designs for light aircraft covering wind tunnel studies of lift drag ratio as function of angle of attack A72-32250
- LIFT FANS**
Lift fan blade interaction discrete frequency noise, discussing potential and viscous interactions relation to rotor-stator spacing A72-32019
Blade characteristics of axial flow fan with orifice fan guide investigation by theoretical model with flat plate parallel to wing tip surface A72-32142
Wind tunnel tests to determine aerodynamic characteristics of V/STOL transport aircraft with tip-turbine driven lift fans [NASA-TM-X-62151] N72-24010
Design and development of turbotip lift fan for use with turbojet gas generator installed on V/STOL transport research aircraft [NASA-CR-120909] N72-24828
- LIFTING BODIES**
Vortex-lattice method for subsonic aircraft aerodynamic coefficients calculation, verifying results with airbus lifting surface wind tunnel test data A72-31401
Numerical analysis of nonhomogeneous flow in two dimensional propulsive lifting system N72-25296
- LIFTING ROTORS**
Application of state transition matrix for numerical analysis of stability and gust response of lifting rotor with rigid flapping blades and rigid hub N72-25001
- LIGHT AIRCRAFT**
Book on airfoil section designs for light aircraft covering wind tunnel studies of lift drag ratio as function of angle of attack A72-32250
- LIQUID COOLING**
Flightweight components and water cooled test adapters for hypersonic engine [NASA-CR-112055] N72-25711
- LITERATURE**
Summary of literature on altimeter display relating to aircraft height [FAA-RD-72-46] N72-25426
- LOAD TESTS**
Low temperature environmental chamber for F-111 proof load testing, describing components of cold air forced convection recirculation system with liquid nitrogen injection

- LOCATES SYSTEM** A72-32612
Location identification system with ground based transmitter and aircraft borne receiver/decoder [NASA-CASE-ERC-10324] N72-25173
- LOGISTICS MANAGEMENT**
Concorde on-time operation as total management problem from design to airline operations, discussing techniques for in-flight failure diagnosis and onward reporting A72-32460
- LOBAN** A72-32460
Fighter bomber Loran-inertial data processing with digital computer to combine navigation, guidance and weapon delivery into fully integrated system A72-33246
- LOW PASS FILTERS**
Low pass filter requirements and performance in variable speed constant frequency system for aircraft electric power supplies [RAE-TR-71088] N72-25273
- LOW TEMPERATURE TESTS**
Low temperature environmental chamber for F-111 proof load testing, describing components of cold air forced convection recirculation system with liquid nitrogen injection A72-32612
- LOW VISIBILITY** A72-33539
Autoland system flight testing in Trident 3B and British Civil Aviation Authority approval for ICAO Cat 3a weather
- M**
- MACH NUMBER**
Noise measurements during shock free and underexpanded operation modes of supersonic cold model jet at moderate exit Mach number A72-32017
- MAGNETIC FIELDS**
Magnetic force welding to form T joints between jet engine parts of dissimilar thickness [NASA-CASE-LEW-10533-2] N72-25479
- MAGNETIC INDUCTION**
Approximate compensation in airborne magnetometry for changing inductive field of aircraft moving through varying geomagnetic field N72-25435
- MAGNETIC RECORDING**
DAMIEN III digital magnetic tape recording system for aircraft flight test data acquisition, discussing components A72-33629
- MAGNETOMETERS**
Approximate compensation in airborne magnetometry for changing inductive field of aircraft moving through varying geomagnetic field N72-25435
- MAGNUS EFFECT**
Effects of longitudinal acceleration and Magnus forces and moments on stability of aircraft with constant velocity around longitudinal axis [AD-738231] N72-24394
- MAINTAINABILITY**
Concorde engines design for maintainability and reliability to reduce turnaround time, discussing diagnostic facilities and on-wing maintenance features A72-32457
Aircraft design for operational reliability and maintainability, emphasizing working relations coordination between manufacturer and operator A72-32459
- MAJFUNCTIONS**
Aircraft industry product support role in time delays minimization for aircraft operators, discussing malfunction report, minimum equipment decision and fault diagnosis A72-32456
- MAN MACHINE SYSTEMS**
Aircraft inertial navigation system, discussing mode selection unit, digital computer and control display for operator communication with system A72-31596
- MANAGEMENT INFORMATION SYSTEMS**
Management information system role in cost effective civil and military aircraft
- operations, discussing hardware modification and human resources and communication system adaptation A72-32458
- MANAGEMENT SYSTEMS**
Papers presented at conference on system safety in government and industry [NASA-TM-X-68369] N72-25961
- MANEUVERABILITY**
Analysis of effects of aircraft maneuvers on characteristics of sonic boom and application of analysis method to various aircraft - Vol. 1 [AD-735296] N72-25011
- MATERIALS HANDLING**
Terminal handling environment and air cargo requirements for noncontainerized freight A72-33175
- MATERIALS TESTS**
Development and evaluation of cooling systems and materials for controlling structural temperature of turbine engines [REPT-21-C-71F] N72-24822
- MATHEMATICAL MODELS**
ATC systems fast-time simulation, emphasizing importance of human operator performance realistic modeling A72-32097
Blade characteristics of axial flow fan with orifice fan guide investigation by theoretical model with flat plate parallel to wing tip surface A72-32142
Mathematical model for influence of lift engine position on eigenmotion of lift jet powered VTOL aircraft in hovering flight [DLR-FB-71-112] N72-24028
Vortex model for calculating airstream at rotor blade of helicopter [NASA-TT-F-14228] N72-24990
Dynamic theory of flutter for rotation of rigid wing [ARL/SM-332] N72-24996
Development of mathematical model for evaluating compatibility of flight crew personnel and aircraft crew stations - Vol. 4 [AD-738008] N72-25017
Mathematical models for analyzing quasi-one-dimensional flow across face seals and narrow slots of turbine engines [NASA-TN-D-6668] N72-25468
- MATRIX METHODS**
Temperature dependent elastoplastic wing assemblies and continua analysis via matrix displacement method A72-33791
- MAXIMUM LIKELIHOOD ESTIMATES**
Maximum likelihood parameter estimation for extracting stability and control derivatives of aircraft from flight test data using real time digital computer [NASA-TN-D-6735] N72-24625
- MEASURING INSTRUMENTS**
Computerized aircraft landing measurement system for civil airport, using optical, seismic and IR sensors A72-33627
Active and passive systems for detecting and measuring air movements with wingtip vortex generation [DOT-TSC-PAA-72-13] N72-25313
- MECHANICAL PROPERTIES**
Mechanical properties of high temperature steels and alloys for gas turbine rotors, disks and blades A72-31703
Mechanical properties of gas turbine vanes and disks [JPRS-55987] N72-24825
Mechanical properties of gas turbine disk material after operation N72-24827
- METAL BONDING**
Adhesive bonding of L-1011 body shell panels for improved fatigue strength and corrosion resistance A72-32429
- METEOROLOGICAL PARAMETERS**
Meteorological data analysis for CAT encounter of Boeing 747 flight over Nantucket Island on 4 November 1970 A72-33525
- MICROWAVE FREQUENCIES**
Low cost microwave scanning beam landing systems

for interim instrument landing system
replacement in civil aviation

A72-32217

MICROWAVES

Performance and problems of microwave guidance
systems for aircraft approach and landing
[RAE-TR-71186] N72-25606

MIDAIR COLLISIONS

Collision avoidance techniques for midair
collisions reduction, discussing airborne and
ground based systems

A72-32213

MILITARY AIR FACILITIES

Integrated civil/military ATC system for upper
airspace control /UAC/ center at Karlsruhe
A72-34108

Mediator plan for joint civil/military ATC
organization at London center, discussing
sectorization, control and radar facilities,
flight plan processing and communications
A72-34109

MILITARY AIRCRAFT

Management information system role in cost
effective civil and military aircraft
operations, discussing hardware modification and
human resources and communication system
adaptation
A72-32458

Pokker VTOL transport aircraft designs,
considering payload, range, runway conditions,
noise, military capabilities and operational costs
A72-33048

Bibliography of control devices to provide
improved tactical ability for jet fighter aircraft
[AD-737694] N72-24036

Senate report on transportation of Government
civil and military passengers and cargo by civil
and military air carriers
[S-REPT-92-503] N72-25948

MILITARY AVIATION

Military aviation navigator training, discussing
objectives, methods, instructors and equipment
A72-32207

USAF Academy air navigation training program,
discussing systems development course and
descriptive and applied astronomy
A72-32210

Military systems cost reduction via civil avionics
procurement techniques, discussing
cost-reliability design criteria
A72-32215

Time parameter in military air operations,
discussing weapon systems R and D, all-weather
capability, communications, reliability and
maintainability, manpower training, etc
A72-32453

ATC system organization in terms of optimal
operating conditions for civil and military
airspace users, discussing navigation systems,
human factors, equipment reliability, etc
A72-32455

MILITARY TECHNOLOGY

Aerodynamic characteristics and performance of
OH-6 helicopter with emphasis on flight loads
imposed during combat operations
[AD-738202] N72-24032

MOBILE LOUNGES

Passenger transfer in airports with total
separation between aircraft and permanent
buildings for independent functioning, noting
Dulles Airport mobile lounges
A72-34143

MOLDING MATERIALS

Epoxy and silicone rubber molding of ice
structures and ice-coated airplane wings
[MEMO-82] N72-24611

MONITORS

Aircraft CRT electronic displays discussing
operational flexibility versus control and
monitor complexities, economics, reliability and
human factors
A72-32636

Monitor and regulator for automatic speed control
and flow velocity measurement in wind tunnel
A72-33609

N**NASA PROGRAMS**

NASA/General Electric joint development of low
noise propulsion technology, describing
demonstrator engine A design, components
development and aerodynamic/acoustic performance
evaluation
[AIAA PAPER 72-657] A72-34077

NAVIGATION AIDS

Great circle intermediate waypoint computation
method for inertial navigation equipped aircraft
A72-32205

Hybrid area navigation and microwave instrument
landing system, discussing approach control and
terminal guidance
A72-32206

Requirements for channel splitting to accommodate
increased VHF omnirange navigation instrument
landing systems, and distance measuring
equipment facilities
[PAPER-54-71/SC122-3] N72-25602

NAVIGATION SATELLITES

Technical and operational aspects of L-band
satellite system for air navigation, discussing
verbal communication, direction finding and
noise interference problems
A72-34138

NAVIGATORS

Military aviation navigator training, discussing
objectives, methods, instructors and equipment
A72-32207

Electronic displays with weapon aiming sensors in
aircraft navigator-attack systems
A72-32634

NICKEL ALLOYS

Aircraft gas turbine engine Ni base alloy disks
and shafts thermomechanical treatment,
considering yield strength and high and low
cycle fatigue resistance
A72-33299

Thermal, tensile, and creep rupture properties of
nickel based alloys for airfoils
[NASA-TM-X-68051] N72-24585

Effect of oxidation-resistant coatings on fatigue
strength of nickel-based alloy for turbine
engine blades
[JPRS-55972] N72-24608

NOISE (SOUND)

Blowdown wind tunnel internal and external noise
fields prediction by empirical method,
considering valves, burners, turbulent boundary
layers and exhaust jets as sources
[AIAA PAPER 72-668] A72-34070

NOISE POLLUTION

Private and governmental regulatory aspects of
environmental noise abatement and control,
discussing legal efforts and trends at local,
state and federal levels
A72-32614

Noise exposure forecasts for airport vicinity in
land use management
[ISAS-476-VOL-37-NO-2] N72-24344

Correlation of total sound power and peak sideline
overall sound pressure level for subsonic and
supersonic jets of aircraft engine exhaust
[NASA-TM-X-68059] N72-24711

NOISE PROPAGATION

Theoretical acoustics applied to jet engine noise
generation, propagation, and reduction studies
N72-25632

NOISE REDUCTION

Low noise aircraft-engine configuration
feasibility, discussing turbofan engine noise
reduction
A72-32322

RB 211 three-shaft turbofan engine for L-1011
airliner, describing design for noise reduction
A72-32428

Private and governmental regulatory aspects of
environmental noise abatement and control,
discussing legal efforts and trends at local,
state and federal levels
A72-32614

STOL aircraft for civil transport applications,
considering optimum design concepts, noise
reduction and terminal facility requirements
A72-33331

- STOL aircraft minimum noise takeoff trajectories determination, taking into account engine thrust and listeners distance from noise source
[AIAA PAPER 72-665] A72-34072
- NASA/General Electric joint development of low noise propulsion technology, describing demonstrator engine A design, components development and aerodynamic/acoustic performance evaluation
[AIAA PAPER 72-657] A72-34077
- Leading edge serrations effect on rotor noise and aerodynamic characteristics, noting vortex and rotational noise reduction and overall efficiency decrease
[AIAA PAPER 72-655] A72-34079
- Sonic boom alleviation by flow field alteration near supersonic aircraft, considering finite rise times, reduced overpressures and shock pressure rises
[AIAA PAPER 72-653] A72-34081
- Jet noise reduction by screen placed across jet flow, investigating acoustic properties, velocity and pressure in mixing zone
[AIAA PAPER 72-644] A72-34088
- Acoustic attenuation and thrust loss incurred by shrouded multistage supersonic jet noise suppressor
[AIAA PAPER 72-642] A72-34090
- Theoretical acoustics applied to jet engine noise generation, propagation, and reduction studies
N72-25632
- NOISE SPECTRA**
Method for computing noise generated by standing and flying jet aircraft
[ONERA-NT-187] N72-25636
- NONDESTRUCTIVE TESTS**
Nondestructive test for failure inspection and quality control of composite structures and materials - conference
[AGARD-R-590] N72-24934
- Nondestructive tests applied to quality control of airframes made of boron composites
N72-24936
- Ultrasonic inspection of wing spar joints on Viscount aircraft
[TR-7105.512] N72-25461
- NONUNIFORM FLOW**
Numerical analysis of nonhomogeneous flow in two dimensional propulsive lifting system
N72-25296
- NOSE WHEELS**
Improved aircraft ground performance in slush and wet runway conditions by addition of extra nose wheel
[ARC-CP-1206] N72-25009
- NOZZLE FLOW**
Supersonic jet noise mechanisms and scaling laws, studying acoustic fields for rectangular and axisymmetric nozzle configurations
[AIAA PAPER 72-641] A72-34091
- NOZZLE GEOMETRY**
Axisymmetric jet impact on ground board for different nozzle configurations and heights in VTOL aircraft aerodynamic studies
A72-33404
- Supersonic jet noise mechanisms and scaling laws, studying acoustic fields for rectangular and axisymmetric nozzle configurations
[AIAA PAPER 72-641] A72-34091
- NUCLEAR POWER PLANTS**
Probabilistic analysis of aircraft crash-caused structural damage to nuclear power plant, using Monte Carlo method and yield line theory for perforation and collapse modes
A72-33600
- NUMERICAL ANALYSIS**
Numerical analysis of potential flow problem of two dimensional airfoil with distributed suction
N72-24359
- Numerical analysis of nonhomogeneous flow in two dimensional propulsive lifting system
N72-25296
- OH-6 HELICOPTER**
Aerodynamic characteristics and performance of OH-6 helicopter with emphasis on flight loads imposed during combat operations
[AD-738202] N72-24032
- OMEGA NAVIGATION SYSTEM**
Avionics equipment for signal processing onboard civil aircraft to improve flight safety, discussing uses of OMEGA navigation system and digital computers
A72-31178
- ONE DIMENSIONAL FLOW**
Mathematical models for analyzing quasi-one-dimensional flow across face seals and narrow slots of turbine engines
[NASA-TN-D-6668] N72-25468
- OPERATIONAL PROBLEMS**
Aircraft CRT electronic displays discussing operational flexibility versus control and monitor complexities, economics, reliability and human factors
A72-32636
- OPERATOR PERFORMANCE**
ATC systems fast-time simulation, emphasizing importance of human operator performance realistic modeling
A72-32097
- OPTICAL MEASURING INSTRUMENTS**
Laser Doppler velocimetry system design for optical measurement of intrablade flow velocity in turbomachinery
A72-32045
- OPTICAL RADAR**
STRADA landing trajectory recording system for real time flight path restitution during approach and landing, using computer and lidar techniques
A72-32895
- Airport runway fog dispersal in UK, discussing cost projection for chemical seeding system combined with lidar remote sensing
A72-33500
- OPTIMAL CONTROL**
Suboptimal feedback control for aircraft gust alleviation design, using indirect perturbation information through normal acceleration factor measurement
A72-32025
- Singular optimal control and minimum time of ascent for supersonic aircraft
N72-24006
- OPTIMIZATION**
Analog simulation method for highly redundant structure optimization based on reproducing structure mechanical behavior in stabilized stress states
A72-32899
- OSCILLATIONS**
Analysis of leading edge flow separation resulting from airfoils oscillating in uniform flow field at low Reynolds numbers
[AD-738304] N72-25320
- OV-1 AIRCRAFT**
Measurement of ground loads on OV-1 aircraft during landings on smooth and rough fields
[AD-737752] N72-24030
- OXYGEN ANALYZERS**
Electromechanical device for recording infrared gaseous oxygen spectra in pressurized aircraft cabin atmosphere
[CL-1971-16] N72-24498
- PACKAGING**
Air cargo intermodal and interline containers handling in warehouse storage, transportation and distribution, considering total pack and interlock requirements
A72-33174
- PAINTS**
Surface properties and soil retention of aircraft painted with polyurethane paint, and requirements for aircraft cleaner
[AD-736971] N72-24613
- PARALLEL PROCESSING (COMPUTERS)**
Univac 1832 multiprocessor avionics computer for airborne ASW, discussing input/output controllers and interfaces and IC design features
A72-33245
- PARAWINGS**
Buoyancy systems and parawings application in short haul passenger transportation, discussing VTOL and STOL operations

- PARTICLE SIZE DISTRIBUTION** A72-33183
Hail size distribution and concentration in thunderstorm updraft regions from aircraft and S band radar observations
- PASSENGER AIRCRAFT** A72-33946
Buoyancy systems and parawings application in short haul passenger transportation, discussing VTOL and STOL operations
- Design, development, and characteristics of aircraft for air bus operations A72-33183
[NASA-TT-P-14240] N72-24013
- Aircraft accidents involving corporate executive aircraft in US general aviation for calendar year 1970 N72-24017
[NTSB-AMM-72-5]
- Flight tests to determine effects of various approach angles on performance of executive transport jet aircraft N72-24022
[FAA-FS-600-7]
- PASSENGERS**
Hierarchical system of helicopter service terminals, calculating passenger lots for single and multiloop arrangements under given stochastic input conditions A72-31498
- Major civil airport passenger and cargo terminal complex design and layout planning, discussing various facilities and equipment requirements A72-33329
- Passenger transfer in airports with total separation between aircraft and permanent buildings for independent functioning, noting Dulles Airport mobile lounges A72-34143
- Passenger, cargo, and mail statistics for commuter air carriers FY 1971 N72-24981
- PERFORMANCE PREDICTION**
Aerodynamic properties prediction procedure for thin jet-flapped airfoil in incompressible inviscid flow bounded by different types of boundaries A72-32147
- Aerodynamic stall characteristic prediction from static experimental data for airfoils, noting boundary layer effects A72-34060
[AIAA PAPER 72-682]
- Computer program for predicting performance, noise, weight, and cost of general aviation aircraft propellers for 1980 time period N72-25005
[NASA-CR-2066]
- PERFORMANCE TESTS**
Worldwide distress alarm, identification and position location system for downed aircraft, discussing GRAN feasibility tests A72-32214
- Performance tests of fan stages operating with oblique weak shocks in rotor blade tip region and analysis of damage in leading edge tip region [NASA-TN-X-68027] N72-24813
- PERIODIC VARIATIONS**
Subsonic wind tunnel for pulsed flows with speed modulation as periodic function of time A72-32898
- PERTURBATION THEORY**
Transonic airfoil section design to given surface pressure distribution, applying finite difference procedures to transonic small disturbance equations A72-34062
[AIAA PAPER 72-679]
- PILOT ERROR**
Aircraft accident report concerning DC-9 aircraft contact with ocean surface and subsequent emergency landing at Martha's Vineyard, Massachusetts, June 22, 1971 N72-25013
[PB-207101]
- PILOT TRAINING**
Low cost flight simulator for general aviation pilot training, containing IPB instrumentation and turbulence injection device A72-32211
- PISTON ENGINES**
Analysis of emissions from aircraft piston and gas turbine engines - tables N72-25589
[PB-207107]
- PITOT TUBES**
Static pressure position error calibrations for compensated and uncompensated XB-70 nose boom pitot static tube N72-24016
[NASA-TN-D-6827]
- PLASTIC COATINGS**
Surface properties and soil retention of aircraft painted with polyurethane paint, and requirements for aircraft cleaner N72-24613
[AD-736971]
- Chemical and structural properties of urethane elastomers and resistance to rain erosion N72-24618
[AD-737624]
- PLATES (STRUCTURAL MEMBERS)**
Resonant vibration of thin walled rods and stiffened plates and cylindrical shells, noting aircraft and rocket structures A72-33679
- PNEUMATIC EQUIPMENT**
Tests of pneumatic servomechanism for use in aircraft control systems N72-24544
[AD-738345]
- POLICIES**
FAA national policies on overall missions and criteria for major subsystems N72-25949
[REPT-1000.27-APP-1]
- National aviation system plan 1973-1982, as joint industry-government program N72-25950
[REPT-1000.27-APP-2]
- POLITICS**
Short haul air transportation system economic and political problems, noting community acceptance and passenger service standards A72-33310
- POLYIMIDES**
Polyimide hydraulic actuator rod seals for application in high performance aircraft N72-24530
[NASA-CR-120878]
- PONTRYAGIN PRINCIPLE**
Pontryagin minimum principle applied to aircraft heading change and aircraft interception N72-24007
[ETN-4]
- POSITION (LOCATION)**
Airport planning in West Germany discussing surface transport facilities and pollution N72-24986
[DGLR-PAPER-71-075]
- POSITION ERRORS**
Relationship between static pressure error /position error/ and measurable flight parameters for different aircraft weights and configurations A72-33637
- Coordinate and speed error dependence on instrumental errors of inertial navigation system using gyrohorizoncompass A72-33960
- Static pressure position error calibrations for compensated and uncompensated XB-70 nose boom pitot static tube N72-24016
[NASA-TN-D-6827]
- POTENTIAL FLOW**
Elliptic-hyperbolic relaxation algorithm for solution to three dimensional nonlinear transonic small disturbance potential equation for flow about swept wings A72-34063
[AIAA PAPER 72-677]
- Numerical analysis of potential flow problem of two dimensional airfoil with distributed suction N72-24359
- POWER SUPPLY CIRCUITS**
Low pass filter requirements and performance in variable speed constant frequency system for aircraft electric power supplies N72-25273
[RAE-TR-71088]
- PREDICTION ANALYSIS TECHNIQUES**
Method for computing noise generated by standing and flying jet aircraft N72-25636
[ONERA-NT-187]
- PRESSURE DISTRIBUTION**
Contracting or diverging stream flow mean velocity change effects on airfoil pressure distribution, circulation and lift, deriving vortex distribution expression A72-32023
- Transonic airfoil section design to given surface pressure distribution, applying finite difference procedures to transonic small disturbance equations A72-34062
[AIAA PAPER 72-679]

- Wind tunnel tests to determine aerodynamic interference and jet-wake interference produced by components of high wing, logistics transport type aircraft
[NASA-TM-X-2530] N72-24020
- Kernel function solution for pressure distribution over wing with oscillating control surfaces in subsonic flow
[NLR-TR-70123-U] N72-24368
- PRESSURE MEASUREMENTS**
Pressure, shear stress and yaw angle measurements in flow through aircraft intake S-shaped ducts with turbulent boundary layer at entry, noting vortex generation A72-33403
- PROBABILITY THEORY**
Probabilistic analysis of aircraft crash-caused structural damage to nuclear power plant, using Monte Carlo method and yield line theory for perforation and collapse modes A72-33600
- PRODUCT DEVELOPMENT**
NASA/General Electric joint development of low noise propulsion technology, describing demonstrator engine A design, components development and aerodynamic/acoustic performance evaluation
[AIAA PAPER 72-657] A72-34077
- PRODUCTION ENGINEERING**
Russian book on aircraft turbine and spacecraft rocket engine assembly covering process schedules, work organization, precision, joints and couplings, quality control, etc A72-33373
- PROPELLER EFFICIENCY**
Leading edge serrations effect on rotor noise and aerodynamic characteristics, noting vortex and rotational noise reduction and overall efficiency decrease
[AIAA PAPER 72-655] A72-34079
- PROPELLER FANS**
Performance tests of fan stages operating with oblique weak shocks in rotor blade tip region and analysis of damage in leading edge tip region
[NASA-TM-X-68027] N72-24813
- PROPELLERS**
Computer program for predicting performance, noise, weight, and cost of general aviation aircraft propellers for 1980 time period
[NASA-CR-2066] N72-25005
- PROPULSION SYSTEM CONFIGURATIONS**
L-1011 propulsion, fuel, flight control, navigation, avionics, communication, electrical, environmental control and auxiliary power systems, discussing structure and high lift devices A72-32427
- PROPULSION SYSTEM PERFORMANCE**
Aero engines and propulsion systems development contribution to air transport economics and regularity, considering environmental factors A72-33313
- PROTECTIVE COATINGS**
Effect of oxidation-resistant coatings on fatigue strength of nickel-based alloy for turbine engine blades
[JPRS-55972] N72-24608
- PULSE CODE MODULATION**
Serial PCM system for flight test data acquisition and reduction compared with Barrier system A72-33644
- PULSE COMMUNICATION**
Avionics research on navigation, identification, and landing systems
[AD-738178] N72-24193
- PURGING**
Purge system and components of HRE AIM
[NASA-CR-112060] N72-25715
- QUALITY CONTROL**
Russian book on aircraft turbine and spacecraft rocket engine assembly covering process schedules, work organization, precision, joints and couplings, quality control, etc A72-33373
- Nondestructive test for failure inspection and quality control of composite structures and materials - conference
[AGARD-R-590] N72-24934
- Nondestructive tests applied to quality control of airframes made of boron composites N72-24936
- QUASI-STEADY STATES**
Hingeless elastic helicopter blades coupled flap-lag motion under quasi-steady aerodynamic loads, reducing equations of motion to coupled nonlinear differential equations A72-31211
- R**
- RADAR BEAMS**
Error analysis for digital avionics system involving Doppler navigation by intermittent scanning of single beam multimode radar, noting optimum statistical data processing A72-32204
- RADAR EQUIPMENT**
Performance tests of acoustic radar equipment to detect vortices formed by low flying aircraft and comparison with conventional sensing methods
[FAA-RD-71-103] N72-25008
- RADAR NAVIGATION**
Tactical approach landing radar tests for low lift drag ratio aircraft in unpowered flight, using P-104D as test aircraft A72-31694
- RADAR RANGE**
Aircraft geodetic coordinates computation from radar range measurements and flight altitude over earth ellipsoid A72-31601
- RADAR SCANNING**
Error analysis for digital avionics system involving Doppler navigation by intermittent scanning of single beam multimode radar, noting optimum statistical data processing A72-32204
- RADAR TRACKING**
ATC procedures training by digital radar simulators, taking into account geographic terrain, radar, wind and aircraft characteristics and flight plans A72-32098
- RADIANT FLUX DENSITY**
IR radiant energy emission from conical jet exhaust of turbojet aircraft A72-32399
- RADIO COMMUNICATION**
Performance tests of L band communication concepts for air traffic control equipment installed in Applications Technology Satellite-F
[NASA-TM-X-65906] N72-25601
- RADIO RECEIVERS**
Solid state modular ground based distance measuring equipment /DME/ receiver for en route aircraft navigation and landing A72-33521
- RADIO TELEMETRY**
Integrated airborne-ground based instrumentation system for variable stability X-22A aircraft flying qualities research, discussing telemetry, mobile van, landing aids and airplane design A72-33628
- RADIO TRANSMISSION**
Aeronautical communication satellite technical and economic survey, considering wave propagation, noise, aircraft antennas and VHF and UHF links A72-31180
- RADOMES**
Flight tests of EC-130E aircraft with X band radome installed
[ENEA-71-45] N72-25007
- RAIL TRANSPORTATION**
Prediction models for dynamic environment experienced by cargo during air and rail transportation A72-32610
- RAIN IMPACT DAMAGE**
Chemical and structural properties of urethane elastomers and resistance to rain erosion
[AD-737624] N72-24618
- RAMJET ENGINES**
Turbulence and fuel-air mixing in supersonic combustion ramjet N72-24807

REAL TIME OPERATION

SUBJECT INDEX

REAL TIME OPERATION

STRADA landing trajectory recording system for real time flight path restitution during approach and landing, using computer and lidar techniques

A72-32895

REATTACHED FLOW

Leading edge boundary layer flow separation and reattachment processes in airfoil dynamic stall, considering effect of angle of attack rate of change

A72-32024

REDUNDANT COMPONENTS

Analog simulation method for highly redundant structure optimization based on reproducing structure mechanical behavior in stabilized stress states

A72-32899

REGULATIONS

Government regulations effects on local service airlines cost performance and growth strategies

A72-33374

REINFORCED PLASTICS

Design, development, and evaluation of glass-reinforced epoxy rotor blades on CH-47 helicopter

[AD-738203]

N72-24033

End oriented, fiber reinforced plastic composites as rain erosion resistant materials

[AD-738079]

N72-24616

RELIABILITY ENGINEERING

Concorde engines design for maintainability and reliability to reduce turnaround time, discussing diagnostic facilities and on-wing maintenance features

A72-32457

Aircraft design for operational reliability and maintainability, emphasizing working relations coordination between manufacturer and operator

A72-32459

REMOTE SENSORS

Airport runway fog dispersal in UK, discussing cost projection for chemical seeding system combined with lidar remote sensing

A72-33500

Computerized aircraft landing measurement system for civil airport, using optical, seismic and IR sensors

A72-33627

RESEARCH AND DEVELOPMENT

Time parameter in military air operations, discussing weapon systems R and D, all-weather capability, communications, reliability and maintainability, manpower training, etc

A72-32453

Scientific articles on research and development in Europe

[AD-737607]

N72-24353

Congressional hearings concerning aeronautical research

N72-25945

RESEARCH FACILITIES

Supersonic combustion research facility design for studying air-fuel mixing processes, shock wave induced temperature and pressure increments and flame holding devices

A72-31815

RESONANT FREQUENCIES

Natural frequencies and vibration modes of free glider, using symmetrical matrix to replace three dimensional structure by approximate model

A72-33409

RESONANT VIBRATION

Resonant vibration of thin walled rods and stiffened plates and cylindrical shells, noting aircraft and rocket structures

A72-33679

RESOURCE ALLOCATION

Management information system role in cost effective civil and military aircraft operations, discussing hardware modification and human resources and communication system adaptation

A72-32458

REYNOLDS NUMBER

Unsteady viscous flow effects on aerodynamic forces exerted on oscillating elliptic airfoil for various Reynolds numbers, angles of attack and frequencies

A72-32344

RIGID ROTORS

Hingeless elastic helicopter blades coupled flap-lag motion under quasi-steady aerodynamic loads, reducing equations of motion to coupled nonlinear differential equations

A72-31211

RIGID WINGS

Dynamic theory of flutter for rotation of rigid wing [ARL/SM-332]

N72-24996

RLC CIRCUITS

Reduced voltage relay operation in aircraft high voltage ac power systems, describing RLC circuit theory, laboratory test arrangement and performance measurements

A72-31215

ROCKET ENGINES

Russian book on aircraft turbine and spacecraft rocket engine assembly covering process schedules, work organization, precision, joints and couplings, quality control, etc

A72-33373

ROCKET VEHICLES

Resonant vibration of thin walled rods and stiffened plates and cylindrical shells, noting aircraft and rocket structures

A72-33679

ROTARY WING AIRCRAFT

Accidents involving rotorcraft in US general aviation for calendar year 1970

[NTSB-AMM-72-3]

N72-24019

ROTARY WINGS

Hingeless elastic helicopter blades coupled flap-lag motion under quasi-steady aerodynamic loads, reducing equations of motion to coupled nonlinear differential equations

A72-31211

Nonlinear analysis of helicopter rotor blade free transverse vibration under air and centrifugal loadings during forward flight, using matrix method

A72-31407

Wind tunnel tests to determine aerodynamic characteristics of powered tilt-rotor aircraft under conditions of hover, transition, and cruise - Vol. 5

[AD-736824]

N72-24001

Durability tests on components of VFW-H3 gyrodyne with determination of rotary wing fatigue life [NASA-TT-P-14284]

N72-24023

Design, development, and evaluation of glass-reinforced epoxy rotor blades on CH-47 helicopter

[AD-738203]

N72-24033

Development of methods for determining lifetime of helicopter components based on working stress and stress-time functions

[NASA-TT-P-14280]

N72-24531

Vortex model for calculating airstream at rotor blade of helicopter

[NASA-TT-P-14228]

N72-24990

Analysis of leading edge flow separation resulting from airfoils oscillating in uniform flow field at low Reynolds numbers

[AD-738304]

N72-25320

ROTATING DISKS

Turbulent flow between rotating disk and turbine engine body calculated from equations of axisymmetric viscous incompressible fluid flow

A72-31702

ROTOR AERODYNAMICS

Leading edge serrations effect on rotor noise and aerodynamic characteristics, noting vortex and rotational noise reduction and overall efficiency decrease

[AIAA PAPER 72-655]

A72-34079

Vortex model for calculating airstream at rotor blade of helicopter

[NASA-TT-P-14228]

N72-24990

ROTOR BLADES

Nonlinear analysis of helicopter rotor blade free transverse vibration under air and centrifugal loadings during forward flight, using matrix method

A72-31407

Application of state transition matrix for numerical analysis of stability and gust response of lifting rotor with rigid flapping blades and rigid hub

- ROTOR BLADES (TURBOMACHINERY)**
 Lift fan blade interaction discrete frequency noise, discussing potential and viscous interactions relation to rotor-stator spacing
 A72-32019
 Rotor head, rotor blade, transmission, and Rolls Royce 360 engine studies
 [AD-737611] N72-25014
- RUNWAY CONDITIONS**
 Airport runway fog dispersal in UK, discussing cost projection for chemical seeding system combined with lidar remote sensing
 A72-33500
 Improved aircraft ground performance in slush and wet runway conditions by addition of extra nose wheel
 [ARC-CP-1206] N72-25009
- S**
- SAFETY MANAGEMENT**
 Papers presented at conference on system safety in government and industry
 [NASA-TN-X-68369] N72-25961
 Air safety program for aircraft manufacturers
 N72-25974
- SAMPLING**
 Checkout of multipoint sampling rake and exhaust emission of turbofan engines
 [PB-207321] N72-25593
- SCALE MODELS**
 Scale model tests of high thrust engine-blast deflection fence combinations for protection of adjacent roadway traffic
 A72-33698
 Prediction of lateral tire dynamic properties of scale model aircraft tires using string theory
 [NASA-CR-2058] N72-24024
- SCALING LAWS**
 Supersonic jet noise mechanisms and scaling laws, studying acoustic fields for rectangular and axisymmetric nozzle configurations
 [AIAA PAPER 72-641] A72-34091
- SCANNING**
 Low cost microwave scanning beam landing systems for interim instrument landing system replacement in civil aviation
 A72-32217
- SCREENS**
 Jet noise reduction by screen placed across jet flow, investigating acoustic properties, velocity and pressure in mixing zone
 [AIAA PAPER 72-644] A72-34088
- SCREWS**
 Characteristics and advantages of flapping wing engine over screw engine
 N72-24118
- SEALS (STOPPERS)**
 Polyimide hydraulic actuator rod seals for application in high performance aircraft
 [NASA-CR-120878] N72-24530
 Mathematical models for analyzing quasi-one-dimensional flow across face seals and narrow slots of turbine engines
 [NASA-TN-D-6668] N72-25468
- SELF SEALING**
 Performance of self-sealing breakaway valves in preventing fuel spillage and fires in survival aircraft crashes
 [AD-738204] N72-24547
- SERVICE LIFE**
 Development of methods for determining lifetime of helicopter components based on working stress and stress-time functions
 [NASA-TT-P-14280] N72-24531
- SERVOMECHANISMS**
 Tests of pneumatic servomechanism for use in aircraft control systems
 [AD-738345] N72-24544
- SHEAR STRESS**
 Pressure, shear stress and yaw angle measurements in flow through aircraft intake S-shaped ducts with turbulent boundary layer at entry, noting vortex generation
 A72-33403
- SHOCK FRONTS**
 Analytical method of characteristics to determine front shock and sonic boom due to flat delta wing with supersonic leading edges
 A72-33401
- SHOCK WAVES**
 Noise measurements during shock free and underexpanded operation modes of supersonic cold model jet at moderate exit Mach number
 A72-32017
 Performance tests of fan stages operating with oblique weak shocks in rotor blade tip region and analysis of damage in leading edge tip region
 [NASA-TN-X-68027] N72-24813
 Analysis of effects of aircraft maneuvers on characteristics of sonic boom and application of analysis method to various aircraft - Vol. 1
 [AD-735296] N72-25011
- SHORT HAUL AIRCRAFT**
 Quiet RTOL /reduced takeoff and landing/ short haul aircraft cost comparison with Trident 3 aircraft up to design range stage length
 A72-31320
 Short haul airlines on-time operation, discussing ATC, weather, cargo and aircraft ground handling, cabin and flight services and aircraft reliability effects
 A72-32452
 Ultrashort haul common carrier air transportation system based on VTOL aircraft for suburban-to-city center trips, comparing with land based transport
 A72-33113
 Short haul air transportation system economic and political problems, noting community acceptance and passenger service standards
 A72-33310
- SHORT TAKEOFF AIRCRAFT**
 Quiet RTOL /reduced takeoff and landing/ short haul aircraft cost comparison with Trident 3 aircraft up to design range stage length
 A72-31320
 Buoyancy systems and parawings application in short haul passenger transportation, discussing VTOL and STOL operations
 A72-33183
 STOL aircraft for civil transport applications, considering optimum design concepts, noise reduction and terminal facility requirements
 A72-33331
 STOL aircraft minimum noise takeoff trajectories determination, taking into account engine thrust and listeners distance from noise source
 [AIAA PAPER 72-665] A72-34072
 Acoustic properties of STOL aircraft with engine over wing configuration and effects of nozzle location, wing shielding, flap leakage, and internally generated exhaust noise
 [NASA-TN-X-68032] N72-24008
 Flight evaluation of takeoff and landing characteristics of short takeoff aircraft to determine limiting factors on short takeoff operation
 [RAE-LIB-TRANS-1604] N72-24026
 Evaluation of STOL modular instrument landing system
 [PAA-NA-72-11] N72-25605
- SHROUDED TURBINES**
 Design of duct turbine as drive system for 20 in. turbofan engine simulators
 [NASA-TN-X-68081] N72-24829
- SIGNAL GENERATORS**
 Instrument landing system simulator including special signal generator for environment simulation
 [RAE-TR-71145] N72-25607
- SIGNAL PROCESSING**
 Avionics equipment for signal processing onboard civil aircraft to improve flight safety, discussing uses of OMEGA navigation system and digital computers
 A72-31178
- SILICONE RUBBER**
 Epoxy and silicone rubber molding of ice structures and ice-coated airplane wings
 [MEMO-82] N72-24611
- SIMULATORS**
 Simulator for physical forces experienced by carrier aircraft during catapult launches and arrested landings, considering external stores safe suspension
 A72-32620

SLENDER BODIES

SUBJECT INDEX

- Design of duct turbine as drive system for 20 in. turbofan engine simulators
[NASA-TN-X-68081] N72-24829
- SLENDER BODIES**
Three dimensional boundary layer separation on slender bodies, delta wings and propulsion intake systems, reviewing computing techniques for interfering inviscid flow fields
A72-32826
- Sonic boom induced flow field at supersonic/hypersonic speeds, using shock expansion method and hypersonic equivalence principle for sharp and blunt nosed bodies
[AIAA PAPER 72-652] A72-34082
- SLENDER WINGS**
Vortex sheet simulation method for slender wing-canard surface nonlinear interaction investigation
A72-33695
- SLOTS**
Mathematical models for analyzing quasi-one-dimensional flow across face seals and narrow slots of turbine engines
[NASA-TN-D-6668] N72-25468
- SLUSH**
Improved aircraft ground performance in slush and wet runway conditions by addition of extra nose wheel
[ARC-CP-1206] N72-25009
- SOCIAL FACTORS**
Airport economic and social impact on environs in terms of community development
A72-33309
- Commercial transport aircraft engine technology contribution to world air transportation, considering social and ecological compatibility with community
A72-33314
- SOLID STATE DEVICES**
Solid state modular ground based distance measuring equipment /DME/ receiver for en route aircraft navigation and landing
A72-33521
- SONIC BOOMS**
Far field sonic boom approach effects, describing Whitham theory extension for ultimate N wave deviations for body configurations with continuous or discontinuous tangent
A72-33010
- Analytical method of characteristics to determine front shock and sonic boom due to flat delta wing with supersonic leading edges
A72-33401
- Sonic boom induced pressure wave propagation and attenuation in water, comparing ballistic range measurements with theoretical predictions
[AIAA PAPER 72-654] A72-34080
- Sonic boom alleviation by flow field alteration near supersonic aircraft, considering finite rise times, reduced overpressures and shock pressure rises
[AIAA PAPER 72-653] A72-34081
- Sonic boom induced flow field at supersonic/hypersonic speeds, using shock expansion method and hypersonic equivalence principle for sharp and blunt nosed bodies
[AIAA PAPER 72-652] A72-34082
- Analysis of effects of aircraft maneuvers on characteristics of sonic boom and application of analysis method to various aircraft - Vol. 1
[AD-735296] N72-25011
- SOUND FIELDS**
Blowdown wind tunnel internal and external noise fields prediction by empirical method, considering valves, burners, turbulent boundary layers and exhaust jets as sources
[AIAA PAPER 72-668] A72-34070
- Supersonic jet noise mechanisms and scaling laws, studying acoustic fields for rectangular and axisymmetric nozzle configurations
[AIAA PAPER 72-641] A72-34091
- Method for computing noise generated by standing and flying jet aircraft
[ONERA-NT-187] N72-25636
- SOUND GENERATORS**
Blowdown wind tunnel internal and external noise fields prediction by empirical method, considering valves, burners, turbulent boundary layers and exhaust jets as sources
- [AIAA PAPER 72-668] A72-34070
- SOUND INTENSITY**
High intensity sound effects on electronic equipment and components in aircraft noise environment, noting whisker diode and printed circuit board damage
A72-32621
- SOUND PRESSURE**
Data correlation of jet noise total sound power and peak sideline overall sound pressure level for subsonic and supersonic convergent exhaust nozzles
[AIAA PAPER 72-643] A72-34089
- Correlation of total sound power and peak sideline overall sound pressure level for subsonic and supersonic jets of aircraft engine exhaust
[NASA-TN-X-68059] N72-24711
- SOUND-SOUND INTERACTIONS**
Lift fan blade interaction discrete frequency noise, discussing potential and viscous interactions relation to rotor-stator spacing
A72-32019
- SPACE PERCEPTION**
Head-up display for aircraft three dimensional sky path observation during navigation and landing, discussing computer units, CRT and image generating subsystems
A72-32042
- SPACECRAFT CONTROL**
Development of thrust control system for application to control of aircraft and spacecraft
[NASA-CASE-MSC-13397-1] N72-25595
- SPACECRAFT LAUNCHING**
Booster launch vehicle guidance scheme for critical aborts from staging through burnout, minimizing aerodynamic phases for different landing sites
A72-32182
- SPECTRAL ENERGY DISTRIBUTION**
IR radiant energy emission from conical jet exhaust of turbojet aircraft
A72-32399
- SPEED CONTROL**
Monitor and regulator for automatic speed control and flow velocity measurement in wind tunnel
A72-33609
- SPOILERS**
Aircraft flight characteristics for landing approach by spoiler-elevator deflection coupling, considering pitch, flight path angle and speed
A72-33423
- Jaguar powered flight controls, discussing wing spoilers, slab tailplane, rudder, autostabilization system and integrated packaging of actuators
A72-34144
- Unsteady response of turbocompressor with inlet flow distorted by square wave and triangular spoilers
[ARC-CP-1203] N72-25000
- STABILITY**
Effects of additives on hydrocarbon jet fuel stability
[AD-737833] N72-24806
- STABILITY DERIVATIVES**
Analysis of techniques and computer programs for extracting stability derivative information from flight test records
[NASA-CR-2016] N72-24991
- Application of state transition matrix for numerical analysis of stability and gust response of lifting rotor with rigid flapping blades and rigid hub
N72-25001
- STANDARDS**
FAA policy in issuing civil airport operating certificates and establishing minimum safety standards
A72-33330
- STATIC PRESSURE**
Pressure, shear stress and yaw angle measurements in flow through aircraft intake S-shaped ducts with turbulent boundary layer at entry, noting vortex generation
A72-33403
- Relationship between static pressure error /position error/ and measurable flight parameters for different aircraft weights and

- configurations
Static pressure position error calibrations for compensated and uncompensated XB-70 nose boom pitot static tube
[NASA-TN-D-6827] A72-33637 N72-24016
- STATISTICAL ANALYSIS**
Statistical analysis of tensile strength and creep data on gas turbine engine alloys
[JPRS-56002] N72-24824
Statistical analysis of mission profiles for passenger- and cargo-transport aircraft
[TB-88] N72-25002
Review of U.S. general aviation accidents for 1969
[NTSB-ARG-71-1] N72-25004
- STATISTICAL CORRELATION**
Statistical correlation techniques applied to jet aircraft autoland system dynamic ground tests with simulated engine and aerodynamic characteristics A72-33641
- STATISTICS**
Individual and group air carrier statistics N72-24979
Passenger, cargo, and mail statistics for commuter air carriers FY 1971 N72-24981
- STATOR BLADES**
Lift fan blade interaction discrete frequency noise, discussing potential and viscous interactions relation to rotor-stator spacing A72-32019
- STEELS**
Mechanical properties of high temperature steels and alloys for gas turbine rotors, disks and blades A72-31703
Fracture mechanics and crack behavior of steel plate and forging materials for aircraft
[AD-737779] N72-24601
- STOCHASTIC PROCESSES**
Hierarchical system of helicopter service terminals, calculating passenger lots for single and multiloop arrangements under given stochastic input conditions A72-31498
- STRATOSPHERE**
Bibliography on SST upper atmospheric environment, listing references to stratospheric structure, composition and physical dynamics, chemical reactions with pollutants, transport properties, etc A72-33797
Climatic changes due to stratospheric perturbation by propulsion effluents of high altitude aircraft flights
[AIAA PAPER 72-658] A72-34076
SST contrails stratospheric dispersion by aircraft wake, atmospheric turbulence and exhaust gases temperature induced buoyancy
[AIAA PAPER 72-650] A72-34084
- STRESS ANALYSIS**
Development of methods for determining lifetime of helicopter components based on working stress and stress-time functions
[NASA-TT-F-14280] N72-24531
- STRESS CONCENTRATION**
Analog simulation method for highly redundant structure optimization based on reproducing structure mechanical behavior in stabilized stress states A72-32899
- STRESS CORROSION**
Ti alloys hot salt stress corrosion during turbine engine operation, noting effects of alloy processing conditions, surface properties and cyclic exposures A72-32136
- STRUCTURAL ANALYSIS**
Analog simulation method for highly redundant structure optimization based on reproducing structure mechanical behavior in stabilized stress states A72-32899
Cost-saving techniques in helicopter structural test methods, suggesting system simulation, component replacement time calculation and computer techniques A72-33221
- STRUCTURAL DESIGN**
Arctic environment surface effect vehicle design, considering structures, drag, lift, propulsive power and range A72-32125
- STRUCTURAL FAILURE**
Aerodynamic noise and structural fatigue failure research and test facility, concerning supersonic jet and V/STOL aircraft A72-32900
Nondestructive test for failure inspection and quality control of composite structures and materials - conference
[AGARD-R-590] N72-24934
- STRUCTURAL MEMBERS**
Explosive compaction and welding for low cost production of helicopter and turbine structural components
[AD-737719] N72-24542
- STRUCTURAL STABILITY**
Analog simulation method for highly redundant structure optimization based on reproducing structure mechanical behavior in stabilized stress states A72-32899
- STRUCTURAL VIBRATION**
Natural frequencies and vibration modes of free glider, using symmetrical matrix to replace three dimensional structure by approximate model A72-33409
- STRUCTURAL WEIGHT**
Relationship between static pressure error /position error/ and measurable flight parameters for different aircraft weights and configurations A72-33637
- SUBSONIC AIRCRAFT**
Vortex-lattice method for subsonic aircraft aerodynamic coefficients calculation, verifying results with airbus lifting surface wind tunnel test data A72-31401
- SUBSONIC FLOW**
Correlation of total sound power and peak sideline overall sound pressure level for subsonic and supersonic jets of aircraft engine exhaust
[NASA-TM-X-68059] N72-24711
- SUBSONIC SPEED**
Data correlation of jet noise total sound power and peak sideline overall sound pressure level for subsonic and supersonic convergent exhaust nozzles
[AIAA PAPER 72-643] A72-34089
- SUBSONIC WIND TUNNELS**
Subsonic wind tunnel for pulsed flows with speed modulation as periodic function of time A72-32898
- SUPERSONIC AIRCRAFT**
Sonic boom alleviation by flow field alteration near supersonic aircraft, considering finite rise times, reduced overpressures and shock pressure rises
[AIAA PAPER 72-653] A72-34081
Singular optimal control and minimum time of ascent for supersonic aircraft N72-24006
Analysis of effects of aircraft maneuvers on characteristics of sonic boom and application of analysis method to various aircraft - Vol. 1
[AD-735296] N72-25011
- SUPERSONIC AIRFOILS**
Analytical method of characteristics to determine front shock and sonic boom due to flat delta wing with supersonic leading edges A72-33401
- SUPERSONIC COMBUSTION**
Supersonic combustion research facility design for studying air-fuel mixing processes, shock wave induced temperature and pressure increments and flame holding devices A72-31815
- SUPERSONIC JET FLOW**
Noise measurements during shock free and underexpanded operation modes of supersonic cold model jet at moderate exit Mach number A72-32017
Acoustic attenuation and thrust loss incurred by shrouded multitube supersonic jet noise suppressor
[AIAA PAPER 72-642] A72-34090

SUPERSONIC NOZZLES

SUBJECT INDEX

- Supersonic jet noise mechanisms and scaling laws, studying acoustic fields for rectangular and axisymmetric nozzle configurations [AIAA PAPER 72-641] A72-34091
- Correlation of total sound power and peak sideline overall sound pressure level for subsonic and supersonic jets of aircraft engine exhaust [NASA-TN-X-68059] N72-24711
- SUPERSONIC NOZZLES**
- Data correlation of jet noise total sound power and peak sideline overall sound pressure level for subsonic and supersonic convergent exhaust nozzles [AIAA PAPER 72-643] A72-34089
- SUPERSONIC SPEEDS**
- Sonic boom induced flow field at supersonic/hypersonic speeds, using shock expansion method and hypersonic equivalence principle for sharp and blunt nosed bodies [AIAA PAPER 72-652] A72-34082
- Turbulence and fuel-air mixing in supersonic combustion ramjet N72-24807
- SUPERSONIC TRANSPORTS**
- Optimum low noise engine selection for transport and combat aircraft relative to range or payload performance, considering CTOL, VTOL, SST and fighter aircraft A72-32127
- Bibliography on SST upper atmospheric environment, listing references to stratospheric structure, composition and physical dynamics, chemical reactions with pollutants, transport properties, etc A72-33797
- SST contrails stratospheric dispersion by aircraft wake, atmospheric turbulence and exhaust gases temperature induced buoyancy [AIAA PAPER 72-650] A72-34084
- SURFACE PROPERTIES**
- Surface properties and soil retention of aircraft painted with polyurethane paint, and requirements for aircraft cleaner [AD-736971] N72-24613
- SURFACE VEHICLES**
- Arctic environment surface effect vehicle design, considering structures, drag, lift, propulsive power and range A72-32125
- SURFACES**
- Numerical analysis of nonhomogeneous flow in two dimensional propulsive lifting system N72-25296
- SWEEP WINGS**
- Elliptic-hyperbolic relaxation algorithm for solution to three dimensional nonlinear transonic small disturbance potential equation for flow about swept wings [AIAA PAPER 72-677] A72-34063
- SYSTEM FAILURES**
- Aircraft industry product support role in time delays minimization for aircraft operators, discussing malfunction report, minimum equipment decision and fault diagnosis A72-32456
- Avionics effects on airline operations timekeeping, considering gains due to all-weather capability and engine monitoring vs possible losses due to equipment failures A72-32461
- SYSTEMS ANALYSIS**
- Main methods of fuel flow measurement and factors for consideration in deciding on type of meter to use for various requirements [AGARDGRAPH-160-VOL-3] N72-25420
- SYSTEMS ENGINEERING**
- Stage removal and addition effect on multistage axial compressor for application in engine design A72-31706
- Total system approach to time scheduled aircraft operations - Conference, London, May 1972 A72-32451
- Integrated airborne-ground based instrumentation system for variable stability X-22A aircraft flying qualities research, discussing telemetry, mobile van, landing aids and airplane design A72-33628
- Airborne flight test data acquisition system modular design to provide digital readings from monitoring transducers analog signal A72-33645
- Design of duct turbine as drive system for 20 in. turbofan engine simulators [NASA-TN-X-68081] N72-24829
- Development of thrust control system for application to control of aircraft and spacecraft [NASA-CASE-MSC-13397-1] N72-25595
- T**
- T-33 AIRCRAFT**
- Flight experiments to determine horizontal visual restriction effects on T-33 aircraft front cockpit during approaches and landings A72-31697
- TABLES (DATA)**
- Analysis of emissions from aircraft piston and gas turbine engines - tables [PB-207107] N72-25589
- TACAN**
- Integrated inertial-VOR-DME or inertial-TACAN navigation system, presenting slant range and bearing adjustment procedure via least squares method A72-34136
- TASK COMPLEXITY**
- Aircraft electronic display for pilot precise control in complex tasks, discussing clarity, stability and readability of CRT images A72-32632
- TECHNOLOGY ASSESSMENT**
- Aeronautical communication satellite technical and economic survey, considering wave propagation, noise, aircraft antennas and VHF and UHF links A72-31180
- TECHNOLOGY UTILIZATION**
- Time/frequency technology application to reliable aircraft collision avoidance system, discussing precision time-ordered techniques, frequency control and synchronization and flying clocks A72-32072
- Flexible wing applications to passenger and cargo transport, discussing gliding and soaring sport, emergency use, powered flight, rocket payload recovery, etc A72-33182
- S-64 Sky crane helicopter current and anticipated applications in commerce and industry, considering logging operations in ecologically sensitive or rugged areas, bridge construction, etc A72-33185
- TEMPERATURE EFFECTS**
- Temperature dependent elastoplastic wing assemblies and continua analysis via matrix displacement method A72-33791
- TENSILE CREEP**
- Statistical analysis of tensile strength and creep data on gas turbine engine alloys [JPNS-56002] N72-24824
- TENSILE PROPERTIES**
- Thermal, tensile, and creep rupture properties of nickel based alloys for airfoils [NASA-TN-X-68051] N72-24595
- TENSILE STRENGTH**
- Statistical analysis of tensile strength and creep data on gas turbine engine alloys [JPNS-56002] N72-24824
- TERMINAL FACILITIES**
- Hierarchical system of helicopter service terminals, calculating passenger lots for single and multiloop arrangements under given stochastic input conditions A72-31498
- Airline maintenance program and facilities for Boeing 747 aircraft based on optimized service concept A72-32430
- Terminal handling environment and air cargo requirements for noncontainerized freight A72-33175
- Major civil airport development plan, discussing traffic forecasts, runways, noise, airspace capacity, access systems, freight installations, maintenance facilities, navigation aids, buildings, etc A72-33328

- Major civil airport passenger and cargo terminal complex design and layout planning, discussing various facilities and equipment requirements
A72-33329
- STOL aircraft for civil transport applications, considering optimum design concepts, noise reduction and terminal facility requirements
A72-33331
- Passenger transfer in airports with total separation between aircraft and permanent buildings for independent functioning, noting Dulles Airport mobile lounges
A72-34143
- Criteria for installation of instrument landing systems and effects of siting on operation of system
[DOT-FAA-6750.16] N72-24338
- Requirements for channel splitting to accommodate increased VHF omnirange navigation instrument landing systems, and distance measuring equipment facilities
[PAPER-54-71/SC122-3] N72-25602
- TERMINAL GUIDANCE**
Hybrid area navigation and microwave instrument landing system, discussing approach control and terminal guidance
A72-32206
- TEST CHAMBERS**
Low temperature environmental chamber for F-111 proof load testing, describing components of cold air forced convection recirculation system with liquid nitrogen injection
A72-32612
- TEST EQUIPMENT**
Airborne external instrumentation pod containing IR scanner and associated test equipment for land and water surveys
A72-33635
- Method for evaluating liquid pump operational and functional performance characteristics
[AD-737713] N72-24541
- Proceedings of conference on applications of laser technology for aerodynamic measurements
[AGARD-LS-49] N72-25493
- TEST FACILITIES**
Inclined wind tunnel test section for free gliding investigation and aerodynamic design of flexible wing two body system
A72-31403
- Free flight follower support system with data reduction for V/STOL or helicopter models, recording flight path and attitude angles
A72-32886
- Flight simulator facility emphasizing lateral-directional control
[NASA-TN-X-62155] N72-24335
- Development and characteristics of support system and data reduction capability for free flight test facility
[ISAS-477-VOL-37-NO-3] N72-24343
- TEST STANDS**
Vibration measurements on walls of turbojet test facility
[TL-1971-11] N72-25898
- THERMAL CONTROL COATINGS**
Development and evaluation of cooling systems and materials for controlling structural temperature of turbine engines
[REPT-21-C-71P] N72-24822
- THERMAL CYCLING TESTS**
Investigating failure of gas turbine vanes under influence of thermal cycles in simulated modes of engine start-up and shut down
N72-24815
- THERMAL PROTECTION**
Thermal aspects of using filamentary composite materials for airframes on atmospheric entry spacecraft
[SD-72-SH-0015] N72-25542
- THERMAL SIMULATION**
Thermal simulation tests for kinetic heating of aerospace structures and materials, describing facilities for supersonic flight and atmospheric reentry
A72-32897
- THERMAL STRESSES**
Temperature dependent elastoplastic wing assemblies and continua analysis via matrix displacement method
A72-32908
- THERMODYNAMICS**
Aerothermodynamic integration model, including flow paths, leading edges, and ducts
[NASA-CR-112059] N72-25714
- THIN AIRFOILS**
Aerodynamic properties prediction procedure for thin jet-flapped airfoil in incompressible inviscid flow bounded by different types of boundaries
A72-32147
- THIN WALLED SHELLS**
Adhesive bonding of L-1011 body shell panels for improved fatigue strength and corrosion resistance
A72-32429
- THREE DIMENSIONAL BOUNDARY LAYER**
Three dimensional boundary layer separation on slender bodies, delta wings and propulsion intake systems, reviewing computing techniques for interfering inviscid flow fields
A72-32826
- Velocity profiles for three dimensional turbulent boundary layer on end wall of axial flow compressor cascade passage under adverse pressure gradients
A72-32901
- THREE DIMENSIONAL FLOW**
Elliptic-hyperbolic relaxation algorithm for solution to three dimensional nonlinear transonic small disturbance potential equation for flow about swept wings
[AIAA PAPER 72-677] N72-34063
- THRUST CONTROL**
V/STOL weapon system VJ-101 design, discussing one axis rocking device, suspension structure and hovering flight thrust control
A72-33049
- THRUST VECTOR CONTROL**
Flight evaluation of vectored-thrust-jet V/STOL aircraft during simulated instrument approaches using Kestrel (XV-6A) aircraft
[NASA-TN-D-6791] N72-24012
- Development of thrust control system for application to control of aircraft and spacecraft
[NASA-CASE-HSC-13397-1] N72-25595
- THUNDERSTORMS**
Hail size distribution and concentration in thunderstorm updraft regions from aircraft and S band radar observations
A72-33946
- TILTING ROTORS**
Wind tunnel tests to determine aerodynamic characteristics of powered tilt-rotor aircraft under conditions of hover, transition, and cruise - Vol. 5
[AD-736824] N72-24001
- Wind tunnel tests to determine aerodynamic effects created by rotor spinup, stopping, and folding on semispan tilt-rotor model - Vol. 7
[AD-736825] N72-24002
- TIME DEPENDENCE**
Time/frequency techniques in land, sea and air transportation environments, discussing characteristics and electronic traffic control systems applications
A72-32073
- TIMING DEVICES**
Time/frequency technology application to reliable aircraft collision avoidance system, discussing precision time-ordered techniques, frequency control and synchronization and flying clocks
A72-32072
- TITANIUM ALLOYS**
Ti alloys hot salt stress corrosion during turbine engine operation, noting effects of alloy processing conditions, surface properties and cyclic exposures
A72-32136
- TORSIONAL STRESS**
Bending and torsional mode deformations of two dimensional elastic wing under sinusoidal and random gust
A72-33229
- TORSIONAL VIBRATION**
Collocation method for coupled bending-bending torsion vibrations of straight uniform cantilever beam with asymmetric airfoil cross section
A72-32908

TRAFFIC CONTROL

SUBJECT INDEX

TRAFFIC CONTROL

Time/frequency techniques in land, sea and air transportation environments, discussing characteristics and electronic traffic control systems applications

A72-32073

TRAINING AIRCRAFT

Canadian Armed Forces air navigation training program, noting emphasis on training flights

A72-32209

TRAINING SIMULATORS

ATC procedures training by digital radar simulators, taking into account geographic terrain, radar, wind and aircraft characteristics and flight plans

A72-32098

Computerized navigator training simulator for complete array of air navigation instruments, discussing design and human factors

A72-32208

TRAJECTORY ANALYSIS

Russian book on flight dynamics covering horizontal flight, takeoff, climb and landing characteristics, meteorological conditions, helicopters, trajectory problems, stability and controllability analysis, etc

A72-33874

STOL aircraft minimum noise takeoff trajectories determination, taking into account engine thrust and listeners distance from noise source [AIAA PAPER 72-665]

A72-34072

TRANSIENT RESPONSE

Aircraft instrumentation system accuracy relation to aerodynamic derivatives evaluated from flight data, proposing input and transient response measurement system

A72-33640

TRANSMITTER RECEIVERS

Location identification system with ground based transmitter and aircraft borne receiver/decoder [NASA-CASE-ERC-10324]

N72-25173

TRANSONIC FLOW

Transonic airfoil section design to given surface pressure distribution, applying finite difference procedures to transonic small disturbance equations

A72-34062

Elliptic-hyperbolic relaxation algorithm for solution to three dimensional nonlinear transonic small disturbance potential equation for flow about swept wings [AIAA PAPER 72-677]

A72-34063

TRANSPORT AIRCRAFT

Fokker VTOL transport aircraft designs, considering payload, range, runway conditions, noise, military capabilities and operational costs

A72-33048

Commercial transport aircraft engine technology contribution to world air transportation, considering social and ecological compatibility with community

A72-33314

Wind tunnel tests to determine aerodynamic characteristics of V/STOL transport aircraft with tip-turbine driven lift fans [NASA-TM-X-62151]

N72-24010

Design, development, and characteristics of aircraft for air bus operations

N72-24013

Effects of gusts, maneuvers, and landing impacts on four-engine cargo aircraft during commercial airlines operation [NASA-TN-D-6790]

N72-24015

Aircraft accidents involving corporate executive aircraft in US general aviation for calendar year 1970

N72-24017

Aircraft accidents involving air taxi operations in US general aviation for calendar year 1970 [NTSB-AMM-72-4]

N72-24018

Wind tunnel tests to determine aerodynamic interference and jet-wake interference produced by components of high wing, logistics transport type aircraft [NASA-TM-X-2530]

N72-24020

TRANSPORTATION

Time/frequency techniques in land, sea and air transportation environments, discussing characteristics and electronic traffic control

systems applications

A72-32073

Transportation - Conference, Washington, D.C., May-June 1972

A72-33180

Airport planning in West Germany discussing surface transport facilities and pollution [DGLR-PAPER-71-075]

N72-24986

TRANSVERSE OSCILLATION

Nonlinear analysis of helicopter rotor blade free transverse vibration under air and centrifugal loadings during forward flight, using matrix method

A72-31407

TU-144 AIRCRAFT

Aerodynamic characteristics and operational capability of TU-144 aircraft [NASA-TT-F-14241]

N72-24009

TURBINE BLADES

Mechanical properties of high temperature steels and alloys for gas turbine rotors, disks and blades

A72-31703

TURBINE ENGINES

Turbulent flow between rotating disk and turbine engine body calculated from equations of axisymmetric viscous incompressible fluid flow

A72-31702

Ti alloys hot salt stress corrosion during turbine engine operation, noting effects of alloy processing conditions, surface properties and cyclic exposures

A72-32136

Russian book on aircraft turbine and spacecraft rocket engine assembly covering process schedules, work organization, precision, joints and couplings, quality control, etc

A72-33373

Development and evaluation of cooling systems and materials for controlling structural temperature of turbine engines

N72-24822

Design and development of turboprop lift fan for use with turbojet gas generator installed on V/STOL transport research aircraft [NASA-CR-120909]

N72-24828

Mathematical models for analyzing quasi-one-dimensional flow across face seals and narrow slots of turbine engines

N72-25468

Analytical measurements of exhaust emissions from aircraft turbine engines using Jet A fuel [BN-R1-7634]

N72-25584

TURBINE WHEELS

Mechanical properties of high temperature steels and alloys for gas turbine rotors, disks and blades

A72-31703

TURBINES

Explosive compaction and welding for low cost production of helicopter and turbine structural components [AD-737719]

N72-24542

TURBOCOMPRESSORS

Stage removal and addition effect on multistage axial compressor for application in engine design

A72-31706

Velocity profiles for three dimensional turbulent boundary layer on end wall of axial flow compressor cascade passage under adverse pressure gradients

A72-32901

Analysis of effect of aerodynamically-induced fluctuation forces on sound produced by axial flow compressor rotor and stator combinations [NASA-CR-2012]

N72-23991

Unsteady response of turbocompressor with inlet flow distorted by square wave and triangular spoilers [ARC-CP-1203]

N72-25000

TURBOFAN ENGINES

Low noise aircraft-engine configuration feasibility, discussing turbofan engine noise reduction

A72-32322

RB 211 three-shaft turbofan engine for L-1011 airliner, describing design for noise reduction

A72-32428

Design of duct turbine as drive system for 20 in. turbofan engine simulators
[NASA-TM-X-68081] N72-24829

Subsonic behavior of three annular airfoils for turbofan engine cowlings
[ARC-R/M-3688] N72-24999

Checkout of multipoint sampling rake and exhaust emission of turbofan engines
[PB-207321] N72-25593

TURBOJET ENGINES
Vibration measurements on walls of turbojet test facility
[TL-1971-11] N72-25898

TURBOMACHINE BLADES
Investigating failure of gas turbine vanes under influence of thermal cycles in simulated modes of engine start-up and shut down
N72-24815

TURBOMACHINERY
Laser Doppler velocimetry system design for optical measurement of intrablade flow velocity in turbomachinery
A72-32045

TURBULENCE
Turbulence and fuel-air mixing in supersonic combustion ramjet
N72-24807

TURBULENCE EFFECTS
Low cost flight simulator for general aviation pilot training, containing IPB instrumentation and turbulence injection device
A72-32211

TURBULENT BOUNDARY LAYER
Velocity profiles for three dimensional turbulent boundary layer on end wall of axial flow compressor cascade passage under adverse pressure gradients
A72-32901

Pressure, shear stress and yaw angle measurements in flow through aircraft intake S-shaped ducts with turbulent boundary layer at entry, noting vortex generation
A72-33403

TURBULENT FLOW
Turbulent flow between rotating disk and turbine engine body calculated from equations of axisymmetric viscous incompressible fluid flow
A72-31702

TURBULENT MIXING
Rotating flow introduction effects on jet noise levels, combustion and turbulent mixing processes and flame stability
[AIAA PAPER 72-645] A72-34087

TURBULENT WAKES
Performance tests of acoustic radar equipment to detect vortices formed by low flying aircraft and comparison with conventional sensing methods
[FAA-RD-71-103] N72-25008

Numerical analysis of finite amplitude waves generated by aircraft trailing vortices to indicate growth of waves on pair of parallel infinite vortices
[AD-737859] N72-25012

TURNING FLIGHT
Pontryagin minimum principle applied to aircraft heading change and aircraft interception
[ETN-4] N72-24007

U

UH-1 HELICOPTER
Hydrofluidic three-axis stability augmentation system to improve UH-1B helicopter damping and handling qualities during high speed gunfiring missions
A72-33650

ULTRAHIGH FREQUENCIES
Performance tests of L band communication concepts for air traffic control equipment installed in Applications Technology Satellite-P
[NASA-TM-X-65906] N72-25601

ULTRASONIC TESTS
Ultrasonic inspection of wing spar joints on Viscount aircraft
[TR-7105.512] N72-25461

UNIVAC COMPUTERS
Univac 1832 multiprocessor avionics computer for airborne ASW, discussing input/output controllers and interfaces and IC design features

UNSTEADY FLOW
Unsteady viscous flow effects on aerodynamic forces exerted on oscillating elliptic airfoil for various Reynolds numbers, angles of attack and frequencies
A72-33245

URBAN DEVELOPMENT
Dallas/Fort Worth airport planning and construction economics impact on community economy and life style
A72-33307

Airport economic and social impact on environs in terms of community development
A72-33309

URBAN TRANSPORTATION
Ultrashort haul common carrier air transportation system based on VTOL aircraft for suburban-to-city center trips, comparing with land based transport
A72-33113

V

V/STOL AIRCRAFT
Free flight follower support system with data reduction for V/STOL or helicopter models, recording flight path and attitude angles
A72-32886

Aerodynamic noise and structural fatigue failure research and test facility, concerning supersonic jet and V/STOL aircraft
A72-32900

V/STOL weapon system VJ-101 design, discussing one axis rocking device, suspension structure and hovering flight thrust control
A72-33049

Wind tunnel tests to determine aerodynamic characteristics of V/STOL transport aircraft with tip-turbine driven lift fans
[NASA-TM-X-62151] N72-24010

Flight evaluation of vectored-thrust-jet V/STOL aircraft during simulated instrument approaches using Kestrel (XV-6A) aircraft
[NASA-TN-D-6791] N72-24012

Design and development of turboprop lift fan for use with turbojet gas generator installed on V/STOL transport research aircraft
[NASA-CR-120909] N72-24828

VANES
Fatigue strength and durability of gas turbine vane models under isothermal and temperature changing conditions
N72-24826

VC-10 AIRCRAFT
Fixed base simulator study of direct lift control on VC-10 aircraft
[ARC-CP-1199] N72-25010

VELOCITY DISTRIBUTION
Velocity profiles for three dimensional turbulent boundary layer on end wall of axial flow compressor cascade passage under adverse pressure gradients
A72-32901

VELOCITY ERRORS
Coordinate and speed error dependence on instrumental errors of inertial navigation system using gyrohorizoncompass
A72-33960

VELOCITY MEASUREMENT
Laser Doppler velocimetry system design for optical measurement of intrablade flow velocity in turbomachinery
A72-32045

Doppler navigation system suitability for area navigation, discussing routes versatility, accuracy and continuous velocity vector sensor
A72-32203

Monitor and regulator for automatic speed control and flow velocity measurement in wind tunnel
A72-33609

VELOCITY MODULATION
Subsonic wind tunnel for pulsed flows with speed modulation as periodic function of time
A72-32898

VERTICAL AIR CURRENTS
Hail size distribution and concentration in thunderstorm updraft regions from aircraft and S band radar observations

VERTICAL TAKEOFF

SUBJECT INDEX

- VERTICAL TAKEOFF** A72-33946
VTOL short haul transportation applications
discussing concept evolution and economic factors A72-33181
Buoyancy systems and parawings application in
short haul passenger transportation, discussing
VTOL and STOL operations A72-33183
- VERTICAL TAKEOFF AIRCRAFT**
Optimum low noise engine selection for transport
and combat aircraft relative to range or payload
performance, considering CTOL, VTOL, SST and
fighter aircraft A72-32127
Jet lift VTOL flight path optimization for minimum
landing transition distance, evaluating
deceleration as function of incidence and thrust
vector angles A72-32323
Fokker VTOL transport aircraft designs,
considering payload, range, runway conditions,
noise, military capabilities and operational costs
A72-33048
Ultrashort haul common carrier air transportation
system based on VTOL aircraft for
suburban-to-city center trips, comparing with
land based transport A72-33113
Axisymmetric jet impact on ground board for
different nozzle configurations and heights in
VTOL aircraft aerodynamic studies A72-33404
Wind tunnel tests to determine aerodynamic effects
created by rotor spinup, stopping, and folding
on semispan tilt-rotor model - Vol. 7
[AD-736825] N72-24002
Acceptability of VTOL aircraft noise determined by
test subjects evaluating simulated sounds of
helicopter, tilt wing aircraft, and turbojet
aircraft [NASA-CR-2043] N72-24025
Mathematical model for influence of lift engine
position on eigenmotion of lift jet powered VTOL
aircraft in hovering flight [DLR-FB-71-112] N72-24028
- VHF OMNIRANGE NAVIGATION**
Integrated inertial-VOR-DME or inertial-TACAN
navigation system, presenting slant range and
bearing adjustment procedure via least squares
method A72-34136
Requirements for channel splitting to accommodate
increased VHF omnirange navigation instrument
landing systems, and distance measuring
equipment facilities [PAPER-54-71/SC122-3] N72-25602
Concepts, philosophy, and development of minimum
operational characteristics for airborne
navigation systems [DO-149] N72-25603
- VIBRATION EFFECTS**
Vibration measurements on walls of turbojet test
facility [TL-1971-11] N72-25898
- VIBRATION MODE**
Natural frequencies and vibration modes of free
glider, using symmetrical matrix to replace
three dimensional structure by approximate model
A72-33409
- VIBRATION TESTS**
Dynamic input to cargo in turbojet aircraft
studied during C141 and C5A flights, discussing
instrumentation, test procedures, data reduction
processes and results A72-32625
- VISCOUS FLOW**
Unsteady viscous flow effects on aerodynamic
forces exerted on oscillating elliptic airfoil
for various Reynolds numbers, angles of attack
and frequencies A72-32344
- VISCOUS FLUIDS**
Turbulent flow between rotating disk and turbine
engine body calculated from equations of
axisymmetric viscous incompressible fluid flow
A72-31702
- VISIBILITY**
Flight experiments to determine horizontal visual
restriction effects on T-33 aircraft front
cockpit during approaches and landings A72-31697
- VISUAL FLIGHT RULES**
Analysis of collision hazards involved in VFR
flight near clouds and effect of safe vertical
clearance from clouds to reduce aircraft accidents
[AD-737804] N72-24682
- VOICE COMMUNICATION**
Adaptive narrow band, frequency modulation, voice
communication system N72-25783
- VORTEX GENERATORS**
Pressure, shear stress and yaw angle measurements
in flow through aircraft intake S-shaped ducts
with turbulent boundary layer at entry, noting
vortex generation A72-33403
Active and passive systems for detecting and
measuring air movements with wingtip vortex
generation [DOT-TSC-PAA-72-13] N72-25313
- VORTEX SHEETS**
Vortex sheet simulation method for slender
wing-canard surface nonlinear interaction
investigation A72-33695
- VORTEX STREETS**
Performance tests of acoustic radar equipment to
detect vortices formed by low flying aircraft
and comparison with conventional sensing methods
[PAA-RD-71-103] N72-25008
- VORTICES**
Vortex-lattice method for subsonic aircraft
aerodynamic coefficients calculation, verifying
results with airbus lifting surface wind tunnel
test data A72-31401
Contracting or diverging stream flow mean velocity
change effects on airfoil pressure distribution,
circulation and lift, deriving vortex
distribution expression A72-32023
Airfoil vortex shedding noise in low-turbulence
flow at helicopter blade Reynolds numbers,
obtaining correlation coefficients for far field
noise and surface pressure fluctuations
[AIAA PAPER 72-656] A72-34078
Rotating flow introduction effects on jet noise
levels, combustion and turbulent mixing
processes and flame stability [AIAA PAPER 72-645] A72-34087
Vortex model for calculating airstream at rotor
blade of helicopter [NASA-TT-P-14228] N72-24990
Numerical analysis of finite amplitude waves
generated by aircraft trailing vortices to
indicate growth of waves on pair of parallel
infinite vortices [AD-737859] N72-25012
- W**
- WALLS**
Vibration measurements on walls of turbojet test
facility [TL-1971-11] N72-25898
- WARNING SYSTEMS**
Worldwide distress alarm, identification and
position location system for downed aircraft,
discussing GRAN feasibility tests A72-32214
SECANT collision avoidance system, describing
operational principles and flight test results
A72-34137
Development of computer program to analyze
effectiveness of pilot warning indicator systems
in avoiding aircraft collisions [NASA-CR-126669] N72-24672
- WATER PRESSURE**
Sonic boom induced pressure wave propagation and
attenuation in water, comparing ballistic range
measurements with theoretical predictions
[AIAA PAPER 72-654] A72-34080

WAVE ATTENUATION

Sonic boom induced pressure wave propagation and attenuation in water, comparing ballistic range measurements with theoretical predictions
[AIAA PAPER 72-654] A72-34080

WAVE PROPAGATION

Sonic boom induced pressure wave propagation and attenuation in water, comparing ballistic range measurements with theoretical predictions
[AIAA PAPER 72-654] A72-34080

WEAPON SYSTEMS

Time parameter in military air operations, discussing weapon systems R and D, all-weather capability, communications, reliability and maintainability, manpower training, etc
A72-32453

Electronic displays with weapon aiming sensors in aircraft navigator-attack systems
A72-32634

V/STOL weapon system VJ-101 design, discussing one axis rocking device, suspension structure and hovering flight thrust control
A72-33049

Fighter bomber Loran-inertial data processing with digital computer to combine navigation, guidance and weapon delivery into fully integrated system
A72-33246

WEAPONS DEVELOPMENT

Time parameter in military air operations, discussing weapon systems R and D, all-weather capability, communications, reliability and maintainability, manpower training, etc
A72-32453

WELDED JOINTS

Magnetic force welding to form T joints between jet engine parts of dissimilar thickness
[NASA-CASE-LEW-10533-2] N72-25479

WIND TUNNEL APPARATUS

Development and characteristics of support system and data reduction capability for free flight test facility
[ISAS-477-VOL-37-NO-3] N72-24343

WIND TUNNEL MODELS

Wind tunnel test data of velocity measurements with hot wire anemometer in wake of CV-990 aircraft model
[NASA-TN-X-62148] N72-23994

Wind tunnel tests to determine aerodynamic characteristics of powered tilt-rotor aircraft under conditions of hover, transition, and cruise - Vol. 5
[AD-736824] N72-24001

Wind tunnel tests to determine aerodynamic effects created by rotor spinup, stopping, and folding on semispan tilt-rotor model - Vol. 7
[AD-736825] N72-24002

Wind tunnel tests to determine aerodynamic characteristics of V/STOL transport aircraft with tip-turbine driven lift fans
[NASA-TN-X-62151] N72-24010

Large-scale wind tunnel investigation of noise characteristics of semispan wing equipped with externally blown jet flaps
[NASA-TN-X-62154] N72-24011

Wind tunnel tests to determine aerodynamic interference and jet-wake interference produced by components of high wing, logistics transport type aircraft
[NASA-TN-X-2530] N72-24020

Development and characteristics of support system and data reduction capability for free flight test facility
[ISAS-477-VOL-37-NO-3] N72-24343

WIND TUNNEL STABILITY TESTS

Wind tunnel tests to determine effects of variations in body shape on aerodynamic characteristics of all-body hypersonic aircraft configuration
[NASA-TN-D-6821] N72-23996

WIND TUNNELS

Inclined wind tunnel test section for free gliding investigation and aerodynamic design of flexible wing two body system
A72-31403

Monitor and regulator for automatic speed control and flow velocity measurement in wind tunnel
A72-33609

Development and characteristics of support system and data reduction capability for free flight

test facility

[ISAS-477-VOL-37-NO-3] N72-24343

Development and characteristics of dual scatter laser Doppler velocimeter for flow distribution measurement in wind tunnels, helicopter downwash, and across high lift wing sections
N72-25506

Installation of structures assembly model and wind tunnel systems
[NASA-CR-112056] N72-25712

WING LOADING

Bending and torsional mode deformations of two dimensional elastic wing under sinusoidal and random gust
A72-33229

WING OSCILLATIONS

Kernel function solution for pressure distribution over wing with oscillating control surfaces in subsonic flow
[NLR-TR-70123-U] N72-24368

WING PROFILES

Vortex sheet simulation method for slender wing-canard surface nonlinear interaction investigation
A72-33695

WING SPAN

Lift and induced drag characteristics of jet flapped finite span wings in close proximity to ground, using method of matched asymptotic expansions
A72-32827

WING TIPS

Blade characteristics of axial flow fan with orifice fan guide investigation by theoretical model with flat plate parallel to wing tip surface
A72-32142

WINGS

Temperature dependent elastoplastic wing assemblies and continua analysis via matrix displacement method
A72-33791

Active and passive systems for detecting and measuring air movements with wingtip vortex generation
[DOT-TSC-PAA-72-13] N72-25313

X

X-22 AIRCRAFT

Integrated airborne-ground based instrumentation system for variable stability X-22A aircraft flying qualities research, discussing telemetry, mobile van, landing aids and airplane design
A72-33628

X-24 AIRCRAFT

Pilot safety considerations in design and operation of X-24A lifting body vehicle
N72-25969

Y

YIELD STRENGTH

Aircraft gas turbine engine Ni base alloy disks and shafts thermomechanical treatment, considering yield strength and high and low cycle fatigue resistance
A72-33299

PERSONAL AUTHOR INDEX

AERONAUTICAL ENGINEERING / A Special Bibliography (Suppl. 22)

SEPTEMBER 1972

Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g., N72-10044. Under any one author's name the accession numbers are arranged in sequence with the IAA accession numbers appearing first.

A

- ADAMS, G. D.
Evaluation of STOL modular instrument landing system (MODILS)
[FAA-NA-72-11] N72-25605
- ALEXANDER, W. T.
Dynamic response of the OV-1A aircraft to soft field landings
[AD-737752] N72-24030
- ALWANG, W. G.
Design of a laser velocimeter for use in turbomachinery. A72-32045
- AMBROSIANI, J. P.
Analysis of a circulation controlled elliptical airfoil N72-24989
- ANSON, B.
Evaluation of self-sealing breakaway valves for crashworthy aircraft fuel systems
[AD-738204] N72-24547
- ARENDR, R. E. A.
Effect of leading edge serrations on noise radiation from a model rotor. A72-34079
Turbulence and acoustic characteristics of screen perturbed jets. A72-34088
[AIAA PAPER 72-644]
- ASANUMA, T.
Unsteady viscous flow around an oscillating elliptic aerofoil. A72-32344
- ATRAGHJI, E. G.
Three-dimensional flow separations on aircraft and missiles. A72-32826
- AUCKEN, J. M.
The philosophy and implementation of a serial PCM system. A72-33644
- AUDY, J. J.
Optimization of structures by simulation A72-32899
- AUER, A. H., JR.
Hail in the vicinity of organized updrafts. A72-33946
- AZUMA, A.

CONTRACT NUMBER INDEX

AERONAUTICAL ENGINEERING / A Special Bibliography (Suppl. 22)
Typical Contract Number Index Listing

SEPTEMBER 1972

Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the IAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the IAA or STAR section.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA deposits its technical documents and bibliographic tools in eleven Federal Regional Technical Report Centers located in the organizations listed below. Each center is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA

University of California, Berkeley

COLORADO

University of Colorado, Boulder

DISTRICT OF COLUMBIA

Library of Congress

GEORGIA

Georgia Institute of Technology, Atlanta

ILLINOIS

The John Crerar Library, Chicago

MASSACHUSETTS

Massachusetts Institute of Technology, Cambridge

MISSOURI

Linda Hall Library, Kansas City

NEW YORK

Columbia University, New York

PENNSYLVANIA

Carnegie Library of Pittsburgh

TEXAS

Southern Methodist University, Dallas

WASHINGTON

University of Washington, Seattle

NASA publications (those indicated by an "*" following the accession number) are also received by the following public and free libraries:

CALIFORNIA

Los Angeles Public Library

San Diego Public Library

COLORADO

Denver Public Library

CONNECTICUT

Hartford Public Library

DELAWARE

Wilmington Institute Free Library, Wilmington

MARYLAND

Enoch Pratt Free Library, Baltimore

MASSACHUSETTS

Boston Public Library

MICHIGAN

Detroit Public Library

MINNESOTA

Minneapolis Public Library

James Jerome Hill Reference Library, St. Paul

MISSOURI

Kansas City Public Library

St. Louis Public Library

NEW JERSEY

Trenton Public Library

NEW YORK

Brooklyn Public Library

Buffalo and Erie County Public Library

Rochester Public Library

New York Public Library

OHIO

Akron Public Library

Cincinnati Public Library

Cleveland Public Library

Dayton Public Library

Toledo Public Library

OKLAHOMA

Oklahoma County Libraries, Oklahoma City

TENNESSEE

Cossitt-Goodwin Libraries, Memphis

TEXAS

Dallas Public Library

Fort Worth Public Library

WASHINGTON

Seattle Public Library

WISCONSIN

Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 750 Third Avenue, New York, New York, 10017.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the National Lending Library for Science and Technology, Boston Spa, Yorkshire, England. By virtue of arrangements other than with NASA, the National Lending Library also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "*" and "#", from: ESRO/ELDO Space Documentation Service, European Space Research Organization, 114, av de Neuilly, 92-Neuilly-sur-Seine, France.

POSTMASTER: If Undeliverable (Section 158
Postal Manual) Do Not Return

"The aeronautical and space activities of the United States shall be conducted so as to contribute . . . to the expansion of human knowledge of phenomena in the atmosphere and space. The Administration shall provide for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof."

— NATIONAL AERONAUTICS AND SPACE ACT OF 1958

NASA SCIENTIFIC AND TECHNICAL PUBLICATIONS

TECHNICAL REPORTS: Scientific and technical information, considered important, complete, and a lasting contribution to existing knowledge.

TECHNICAL NOTES: Information less broad in scope but nevertheless of importance as a contribution to existing knowledge.

TECHNICAL MEMORANDUMS: Information receiving limited distribution because of preliminary data, security classification, or other reasons.

CONTRACTOR REPORTS: Scientific and technical information generated under a NASA contract or grant and considered an important contribution to existing knowledge.

TECHNICAL TRANSLATIONS: Information published in a foreign language considered to merit NASA distribution in English.

SPECIAL PUBLICATIONS: Information derived from or of value to NASA activities. Publications include conference proceedings, monographs, data compilations, handbooks, sourcebooks, and special bibliographies.

TECHNOLOGY UTILIZATION PUBLICATIONS: Information on technology used by NASA that may be of particular interest in commercial and other non-aerospace applications. Publications include Tech Briefs, Technology Utilization Reports and Technology Surveys.

Details on the availability of these publications may be obtained from:

SCIENTIFIC AND TECHNICAL INFORMATION OFFICE
